High Resolution Microbore
Reversed-Phase HPLC
hGH Tryptic Digest

Application
Biochemical
Robert Ricker

The multiple peptide peaks resulting from reversed-phase HPLC of protein digests provide important information about a protein. Additionally, the peaks may be collected and analyzed further (e.g., through mass spectrometry). It is, therefore, important that the peptide sample be chromatographed with high resolution and with reproducibility run-after-run.

Highlights

- ZORBAX StableBond C18 columns provide excellent resolution of peptides.

- Availability of ZORBAX StableBond packings in a 1.0 mm i.d. microbore column allows dependable HPLC results under sample-limited conditions.

- ZORBAX StableBond chemistry has excellent stability, especially at low pH.

Conditions:
ZORBAX 300SB-C18 (1.0 x 250 mm) (MicroTech Scientific)
Mobile Phase: A: H2O / ACN / TFA 98/2/0.1 B: ACN H2O / TFA 90/10/0.09
Gradient: 0-60% B at 0.5% B/min.
Injection: 10µL (70 pmole), 50 µL/min, 50°C, Detect. UV(214 nm)
Sample: Courtesy of Genentech Inc., South SanFrancisco
