Application Note
Guideline for Determination of Fibronectin in Serum/Plasma on Cobas MIRA Plus

General information

Intended use
The Application Note is intended for the quantitative determination of fibronectin in human sample material by turbidimetry on Cobas MIRA Plus (1, 2).

Measuring range
Approximately 0.03-0.7 g/L depending on the specific lot of the calibrator. In case of post-dilution the range can be expanded to 0.03-2 g/L.

Reference interval
0.20-0.40 g/L (3). It is recommended to determine the reference interval for the local population.

Instrument settings
Instrument programming is performed according to “Instrument Settings” on page 3.

Samples
Human EDTA-plasma. Human serum has approximately 20% lower concentrations. Stable for 7 days at 2-8 ºC.

Calibrator
Dilution of standards is performed automatically by the instrument.

Reaction buffer
The reaction buffer is ready for use.

Antibody
Predilute the antibody 1:1.25 (e.g. 2000 µL antibody + 500 µL diluent).
If in rare cases the prediluted antibody appears slightly turbid, filtration through a 0.22 µm membrane filter is recommended.
Stability of undiluted antibody: See expiry on the label.
Stability of prediluted antibody: 28 days at 2-8 ºC.

Capacity: 1 mL of prediluted antibody is equivalent to approximately 20 cuvette readings of standards or samples. The dead volume of the reagent bottle should be considered when calculating the required amount of reagent.

Calibration stability
It is recommended to recalibrate every 28th day or when reagent lots change, a new antibody dilution is prepared, the antibody dilution is filtered, or quality control results fall outside the range as established by the individual laboratory.

Trouble shooting
If performance is unacceptable, try to recalibrate. Check reagents and procedure. If the problem persists, please contact instrument supplier or DakoCytomation Technical Service.
Performance Data

Sensitivity
An OD value of approximately 0.13 on Cobas MIRA Plus corresponds to a concentration around 0.7 g/L fibronectin.

Detection limit
The detection limit is estimated to 0.001 g/L.

Precision
The precision was estimated by testing at 2 different levels of fibronectin by ANOVA analysis of 6 runs each with a new calibration and 6 determinations in each run.

Accuracy
A recovery of fibronectin of 90-110% can be expected for Dade Behring N/T Protein Control PY, code No. OWSY.

Linearity
The assay is linear in the range 0.03-0.7 g/L.

Security range
No antigen excess is found for fibronectin concentrations up to 3.6 g/L (the highest concentration tested).

Interference
No interference is found at concentrations up to 10 g/L of hemoglobin, 600 mg/L of bilirubin, and 12.5 g/L of triglyceride.

All drugs described in reference 4 were investigated according to the recommendations in reference 4. No interference was observed, except for Intralipid at 10 g/L.

Method comparison
Determination of fibronectin according to this Application Note was compared with other commercial turbidimetric assays. Data are available on request.

  [*] Calibrator, code No. OUID. The concentration is calculated as the factor times the calibrator value for the specific lot (C_cal, stated in g/L on the OUID Analytical Value Sheet).

  [**] These values are not input. They are calculated automatically by the instrument from the "MAIN STD" and "FACT.STD" in the "ANALYSIS" section of the instrument settings. The values vary slightly with the calibrator value.
