Simultaneous Analysis of Antifungals in Plasma by SPE with Agilent Bond Elut Plexa and an Agilent 1260 Infinity LC/MS/MS

Application Note

Abstract

Multicomound analysis of six systemic antifungal drugs in human plasma is effectively achieved using an Agilent LC/MS/MS system composed of an Agilent Bond Elut Plexa polymeric sorbent, an Agilent Pursuit XR_{2.8} Diphenyl column, and an Agilent 1260 Infinity LC Triple Quadrupole LC/MS. Agilent Bond Elut Plexa delivered extremely clean samples, which was demonstrated by detection down to pg levels. All compounds showed near 100% recovery and a single digit % RSD. Superb linearity was achieved in the calibration curves with $R^2 \geq 0.995$ for all compounds.

Introduction

Systemic antifungal medications are designed to treat fungal infections in the human body. Many single-compound analyses have been reported; however, multicomound analyses with low detection limits have limited availability and have not yet been established [1-4]. The Agilent high quality, mono-disperse polymeric solid phase extraction (SPE) plate, Bond Elut Plexa, delivers clean samples to achieve extremely low-picogram (pg) detection limits of multi-antifungal drugs in human plasma. This application note presents good recovery, linearity, and precision data on antifungal drugs in human plasma.
Figure 1 shows examples of systemic antifungal drugs.

Itraconazole  
MW: 306.27  
log P: 5.66

Ketoconazole  
MW: 531.43  
log P: 4.35

Difenoconazole  
MW: 406.26  
log P: 4.30

Linezolid  
MW: 337.35  
log P: 0.90

Voriconazole  
MW: 349.31  
log P: 1.80

Bitertanol  
MW: 337.42  
log P: 4.16

Fluconazole  
MW: 306.27  
log P: 0.40

Materials and Methods

SPE reagents and solutions

SPE sorbent: Agilent Bond Elut Plexa 96-well plate (10 mg) (p/n A4969010)
Sample: 100 µL human plasma spiked with antifungals
Ammonia: 2% aqueous ammonia
Methanol: reagent grade or higher, 10% MeOH

SPE method
1. Pretreatment: Dilute with 300 µL 2% aqueous ammonia
2. Condition: 1. 500 µL MeOH
   2. 500 µL H₂O
3. Load: 400 µL diluted sample from pretreatment (100 µL of actual plasma)
4. Wash: 500 µL 10% MeOH
5. Elute: Twice with 250 µL MeOH
6. Evaporate/reconstitute: Evaporate under gentle air stream at room temperature and reconstitute in 100 µL 30% MeOH

“Difenoconazole, internal standard (IS), was spiked at 50 ng/mL in all samples

Calibration samples were prepared from 0.05 to 100 ng/mL in human plasma at 0.05, 0.1, 0.5, 1, 5, 10, 50, and 100 ng/mL. For itraconazole, linezolid, and betertanol, a concentration range of 0.5 to 100 ng/mL was used due to detection limits.

LC/MS conditions

Column: Agilent Pursuit XRs Ultra 2.8 Diphenyl, 2.0 x 50 mm (p/n A7521050X020)
Instrument: Agilent 1260 Infinity Triple Quadrupole LC/MS
Mobile phase A: 0.1% formic acid in H₂O
Mobile phase B: MeOH
Flow rate: 0.4 mL/min
Injection volume: 5 µL
Gradient:

Results and Discussion

Figure 2 shows all compounds were baseline-separated chromatographically with good retention using the Agilent Pursuit XRs Ultra 2.8 Diphenyl column. Excellent detection limits were achieved for most compounds with the Agilent 1260 Infinity Triple Quadrupole LC/MS, down to the 0.05 ng/mL level in human plasma.

Figure 2. MS chromatogram for antifungal drugs at 10 ng/mL spiked in human plasma (IS was spiked at 50 ng/mL).
All compounds showed great linearity with $R^2 \geq 0.995$ over the entire calibration range (Figure 3).

**Figure 3.** Calibration curves for antifungals in human plasma from 0.05 to 100 ng/mL (itraconazole, linezolid, and bitertanol use a 0.5 to 100 ng/mL range due to LOD).
A recovery experiment was performed with $n = 6$ samples for four different concentration levels: 1, 5, 50, and 100 ng/mL spiked in human plasma. Most of the compounds showed excellent recovery and % RSD values for all concentration levels.

**Conclusion**

A reproducible and accurate analytical method was developed for several antifungal drugs in human plasma. Agilent Bond Elut Plexa delivered clean samples, which was demonstrated by the detection of pg levels of antifungals. All compounds showed close to 100% recovery and a single digit % RSD with $n = 6$ samples. Superb linearity was achieved in the calibration curves with $R^2 \geq 0.995$ for all compounds.
