**Applications of planar microfluidic devices and gas chromatography for complex problem solving**

Jim Luong *et al.*

**Tags**
LOWOX, VF-1ms, DB-1, HP-INNOWax, PoraBOND Q, HP-PLOT Q, Capillary Flow Union, 6890N GC, 7890A GC, energy and chemicals, refining

**Abstract**
A wide range of Agilent J&W GC columns and instruments were used in a comprehensive examination of microfluidic devices for hydrocarbon analysis. Published by John Wiley and Sons Ltd.

**Determination of trace ethylene glycol in industrial solvents and lubricants using phenyl boronic acid derivatization and multidimensional gas chromatography**

J. Luong *et al.*

**Tags**
DB-1, VF-200ms, Ultra Inert liner, 6890N GC, 5975B MSD, energy and chemicals, petrochemicals

**Abstract**
Agilent J&W GC columns in an Agilent GC/MSD system was used to characterize trace ethylene glycol in industrial solvents and lubricants. Published by Elsevier B. V.

**Multidimensional GC using planar microfluidic devices for the characterization of phenolic antioxidants in fuels**

J. Luong *et al.*

**Tags**

Abstract
There is an urgent need to develop odor reduction technologies for animal production facilities, and this requires a reliable measurement technique for estimating the removal of odorants. The purpose of the present experiment was to investigate the application of proton-transfer-reaction mass spectrometry (PTR-MS) for continuous measurements at a biofilter from SKOV A/S installed at a pig production facility. PTR-MS was able to handle the harsh conditions with high humidity and dust load in a biofilter and provide reliable data for the removal of odorants, including the highly odorous sulfur compounds. The biofilter removed 80–99% of carboxylic acids, aldehydes, ketones, phenols, and indoles and ca. 75% of hydrogen sulfide. However, only ~0–15% of methanethiol and dimethyl sulfide was removed. In conclusion, PTR-MS is a promising tool that can be used to improve the development of biological air cleaning and other odor reduction technologies toward significant odorants. Abstract
A major component of laundry malodor in japan is 4-methyl-3-hexenoic acid (4M3H), quantified by Agilent J&W GC columns fitted to an Agilent 6890N/5975 GC/MS. Published by the American Society for Microbiology.
Evaluation of Single Column Trapping/Separation and Chemiluminescence Detection for Measurement of Methanethiol and Dimethyl Sulfide from Pig Production

Tags

Abstract
Reduced sulfur compounds are considered to be important odorants from pig production due to their low odor threshold values and low solubility in slurry. The objective of the present study was to investigate the use of a portable method with a single silica gel column for trapping/separation coupled with chemiluminescence detection (SCTS-CL) for measurement of methanethiol and dimethyl sulfide in sample air from pig production. Proton-transfer-reaction mass spectrometry (PTR-MS) was used to evaluate the trapping/separation. The silica gel column used for the SCTS-CL efficiently collected hydrogen sulfide, methanethiol and dimethyl sulfide. The measurement of methanethiol by SCTS-CL was clearly interfered by the high concentration of hydrogen sulfide found in pig production, and a removal of hydrogen sulfide was necessary to obtain reliable results.

Air samples taken from a facility with growing-finishing pigs were analyzed by SCTS-CL, PTR-MS, and a gas chromatograph with sulfur chemiluminescence detection (GC-SCD) to evaluate the SCTS-CL. The difference between the concentrations of methanethiol and dimethyl sulfide measured with SCTS-CL, PTR-MS, and GC-SCD was below 10%. In conclusion, the SCTS-CL is a portable and low-cost alternative to the commercial methods that can be used to measure methanethiol and dimethyl sulfide in sample air from pig production. © The Authors.

Direct and simultaneous determination of trace-level carbon tetrachloride, peroxyacetyl nitrate, and peroxypropionyl nitrate using gas chromatography-electron capture detection

Tags

Abstract
The authors describe a novel method for measuring atmospheric carbon tetrachloride, peroxyacetyl nitrate, and peroxypropionyl nitrate directly and simultaneously in air using GC/ECD with an Agilent J&W DB-1 GC column. Published by Elsevier B. V.

Abstract
Partially methylated alditol acetates were analyzed by gas-liquid chromatography on an Agilent J&W CP-Sil 43 CB column and by gas-liquid chromatography-mass spectrometry on an Agilent J&W DB-1 column. Published by the American Society for Microbiology.

Pressurized hot water extraction coupled to molecularly imprinted polymers for simultaneous extraction and clean-up of pesticides residues in edible and medicinal plants of the Okavango Delta, Botswana

Abstract
Organochlorine pesticides residue levels in various edible and medicinal plants of the Okavango Delta, Botswana were analyzed using an Agilent J&W DB-1 GC column fitted to an Agilent 6890 gas chromatograph with an electron capture detector. Published by De Gruyter.
Abstract
Since decades mimosa (*Acacia dealbata*) absolute oil has been used in the flavor and perfume industry. Today, it finds an application in over 80 perfumes, and its worldwide industrial production is estimated five tons per year. Here we report on the chemical composition of French mimosa absolute oil. Straight-chain analogues from C6 to C26 with different functional groups (hydrocarbons, esters, aldehydes, diethyl acetals, alcohols, and ketones) were identified in the volatile fraction. Most of them are long-chain molecules: (Z)-heptadec-8-ene, heptadecane, nonadecane, and palmitic acid are the most abundant, and constituents such as 2-phenethyl alcohol, methyl anisate, and ethyl palmitate are present in smaller amounts. The heavier constituents were mainly triterpenoids such as lupenone and lupeol, which were identified as two of the main components. (Z)-Heptadec-8-ene, lupenone, and lupeol were quantified by GC–MS in SIM mode using external standards and represents 6%, 20%, and 7.8% (w/w) of the absolute oil. Moreover, odorant compounds were extracted by SPME and analyzed by GC-sniffing leading to the perception of 57 odorant zones, of which 37 compounds were identified by their odorant description, mass spectrum, retention index, and injection of the reference compound.
