Glycan graphical representations follow the recommendations of the Consortium for Functional Glycomics[3] (CFG) and were drawn using GlycoWorkbench 2.1[4]. Neu5Ac = N-acetylneuraminic acid; Gal = galactose; Man = mannose; GlcNAc = N-acetylglucosamine; Fuc = fucose.

The α(2,3) sialic acid linkage is found on glycoproteins produced in Chinese hamster ovary (CHO) cells[5]. In contrast, human intravenous immunoglobulin (IVIG) IgG Fc N-glycans are predominantly α(2,6)-sialylated[6].
