I simboli utilizzati per rappresentare i glicani seguono le raccomandazioni del Consorzio per la glicomica funzionale (Consortium for Functional Glycomics³, CFG) e sono stati disegnati usando GlycoWorkbench 2.1⁴. Neu5Ac = acido N-acetilneuramminico; Gal = galattosio; Man = mannosio; GlcNAc = N-acetilglucosammina; Fuc = fucosio.

L'acido sialico con legame $\alpha(2,3)$ è presente sulle glicoproteine prodotte nelle cellule di ovaio di criceto cinese (CHO)⁵. Gli N-glicani nella regione Fc dell'immunoglobulina G umana per uso endovenoso (IVIG) sono, invece, prevalentemente sialilati in posizione $\alpha(2,6)$ ⁶.
