Congratulations on taking a big step in pesticide and mycotoxin analysis for cannabis flower samples. Through the purchase of the Agilent Cannabis Pesticide and Mycotoxin kit, you have received the necessary consumables and resources to get up and running—FAST!

This guide provides additional information about each of the parts included in your kit, including application-specific maintenance recommendations, and is broken into the following sections:

**Sample preparation**

**Includes p/n:**
- 5982-1365
- 5982-9313
- 5610-2049

**Sample containment**

**Includes p/n:**
- 5183-2072
- 5182-0718

**Instrument supplies**

**Includes p/n:**
- G2453-85060
- G1946-85021

**Separation**

**Includes p/n:**
- 695975-312
- 823750-914
Cannabis Pesticide and Mycotoxin Kit – LC/MS only, p/n 5610-2050

Sample preparation

SampliQ SPE cartridges: C18 endcapped, 6 mL tubes, 500 mg, 30/pk
Qty: 14
p/n 5982-1365

Optimized sample preparation is critical for successful pesticide and mycotoxin determination in dry cannabis flower. Agilent SampliQ C18 endcapped solid phase extraction (SPE) cartridges are used for “pass-through cleanup” of cannabis extracts. With pass-through cleanup, the sample extract is sent through the cartridge to allow the pesticides and mycotoxins to pass through, and interfering compounds to be retained on the cartridge. The significant endcapping provides a more inert cleanup, and will be less likely to retain analytes of interest on the cartridge. Cartridges are designed for one-time use, and should be discarded after extraction.

Ceramic homogenizers for 50 mL tubes, 100/pk
Qty: 8
p/n 5982-9313

Ceramic homogenizers are used to grind your cannabis sample using vertical shaking. They make analyte extraction easier by:
• Increasing extraction efficiency
• Maintaining reproducible extractions
• Minimizing grinding/extraction variance between users

Use two ceramic homogenizers per sample. Ceramic homogenizers are intended for one-time use, and should be discarded after use.

Centrifuge tubes, 50 mL, 25/pk
Qty: 32
p/n 5610-2049

Centrifuge tubes (50 mL) are essential for cannabis sample preparation. One centrifuge tube is used to prepare the initial cannabis sample. Another centrifuge tube is used to collect the final eluent after the SPE protocol. When using these tubes, do not overtighten the caps. These tubes are designed to seal with very little tightening, and can leak if overtightened. For the best seal, ensure that the sealing surface is free of powders, sample, or liquid before placing the cap on the tube.
User tip: Use the Agilent 6 mL SPE cartridge rack (p/n 5191-4104) and PPM-48 waste rack (p/n 5191-4102) to set up your SampliQ SPE cartridges and 50 mL centrifuge tubes easily. Note: Only the aforementioned racks, and not a PPM-48 processor, is recommended for this extraction.

To streamline your cannabis workflow, see Table 1 for more one-time use purchases and recommended consumables.

Sample containment

Vial, screw top, amber, write-one spot, deactivated (silanized), certified, 2 mL, 100/pk

Qty: 4
p/n 5183-2072

Screw top vials are an excellent alternative to crimp cap vials, and eliminate the need for a manual or automatic crimper. The amber color is necessary for cannabis samples that may have sensitive compounds (semivolatile organic compounds or pesticides that tend to break down or "disappear" in the inlet/column, are sensitive to temperature, or known to degrade over time when in a mixture). The amber vial reduces the risk of analyte loss due to exposure to light.

Cap, screw, green, PTFE/red silicone septa, 100/pk

Qty: 4
p/n 5182-0718

This cap features a PTFE/red silicone septum, which is compatible with most solvents. PTFE is least likely to interact with the sample and less likely to extract siloxanes into the sample that can interfere chromatographically with your analytes of interest. Screw caps are easier to use, and eliminate the need for a manual or automatic crimper. Plus, you do not need to worry about overcrimping or undercrimping the cap, which can lead to analyte loss.
Instrument supplies

Formic acid (mobile phase modifier), 1 × 5 mL vial
Qty: 1
p/n G2453-85060

Ammonium formate (mobile phase modifier), 6 × 2.2 mL vial
Qty: 1
p/n G1946-85021

Formic acid and ammonium formate are high-quality mobile phase modifiers that help improve your overall chromatography. These modifiers work together to:

- Improve peak shape by minimizing unwanted interactions between the analyte and the column stationary phase
- Increase sensitivity by improving ionization
- Control the analyte ionization state that can be used to achieve baseline resolution and separate isobars or matrix components from your sample

Separation

Agilent InfinityLab Poroshell 120 Phenyl-Hexyl, 3.0 × 100 mm, 2.7 μm LC column
Qty: 1
p/n 695975-312

This is your main liquid chromatography column that separates your analytes from other molecules present in the sample. Separation of analytes from other, irrelevant components is key to reliable detection and quantification of sample components. Application specific: Replace approximately every 400 injections.
Agilent InfinityLab Poroshell 120 Phenyl-Hexyl, 3 × 5 mm, 2.7 µm, UHPLC guard, 3/pk
(Qty: 1)
p/n 823750-914

A guard column is a short metal tube filled with silica material that is identical to the material of your main LC column. Guard columns are not meant to separate your sample but to protect your main column from clogging with particles or sample compounds that stick to the column phase material and alter its properties. The guard column is “sacrificed” and regularly exchanged to increase the lifetime of your main LC column. **Application specific**: Replace approximately every 135 injections.

**How to connect your LC column**

1. Check the direction of flow.
2. This is where the flow enters the column. Connect the guard column here.
3. Connect the inlet of your guard column with the capillary that comes from the injector.
4. Here, the flow leaves the column; connect with capillary fitting to the detector.

Figure 1. How to connect your LC column.
Additional recommended products to complete your workflow

Agilent Cannabis Pesticide and Mycotoxin Kits were designed to provide you with consumables for 400 runs. Use this table for guidance on one-time purchase items and recommendations for additional products that support this workflow.
