Software Revision
This guide is valid for A.01.xx revisions of the Agilent G1369A LAN Interface software, where xx refers to minor revisions of the software that do not affect the technical accuracy of this guide.

Warranty
The material contained in this document is provided “as is,” and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Agilent disclaims all warranties, either express or implied, with regard to this manual and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Agilent shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Technology Licenses
The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

Restricted Rights Legend
If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as "Commercial computer software" as defined in DFAR 252.227-7014 (June 1995), or as a “commercial item” as defined in FAR 2.101(a) or as “Restricted computer software” as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies’ standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

Safety Notices

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.
In This Guide...

This guide contains information to install the LAN Interface (G1369A).

1 Introduction - Around your LAN Interface

In this chapter you will find an introduction to the LAN Interface and its function.

2 Getting Started

In this chapter you will find instructions to help you to set-up your LAN Interface.

3 Getting Help

In this chapter you will find support information about troubleshooting, repair and the Agilent web.

Introduction - Around your LAN Interface

Introduction to the LAN Interface  8
LAN control - what exactly does it do?  9
LAN Interface - what has to be done?  9
LAN control configurations  10
Local configuration using cross-over cable  10
LAN using a HUB and twisted pair cables  10
LAN with existing customer network  11
LAN Interface compatibility  12

In this chapter you will find an introduction to the LAN Interface and its function.
Introduction to the LAN Interface

The LAN Interface (Local Area Network) is the Agilent replacement for the previously used HP JetDirect card in the Agilent 1100 series HPLC modules and the 8453 UV-vis spectrophotometer.

Figure 1  LAN Interface
LAN control - what exactly does it do?

In its simplest form...

- control of your instrument and acquires data “remotely” from your desktop (easier access),
- a direct replacement for GP-IB (HP-IB) interface protocol,
- allows your instrument to be placed anywhere on the laboratory/corporate network,
- improves lab “ergonomics” (better organization),

LAN Interface - what has to be done?

- install LAN Interface into the instrument
- install network interface card (NIC) into PC (if not already pre-installed or on-board).
- connect to instrument
  - direct with cross-over cable or
  - to HUB with twisted pair cable
- configure instrument on LAN
LAN control configurations

The basic LAN configurations are shown below.

**Local configuration using cross-over cable**

The simplest way is a configuration with a single system.

![Figure 2](image)

**LAN using a HUB and twisted pair cables**

More complicated setup than direct cross-over connection.

![Figure 3](image)
LAN with existing customer network

Use MDI/MDI-X port or “Cascade” Port with standard twisted pair cable to connect Hub to a “parent” hub. IP Addresses and other TCP/IP configuration information MUST be provided by the customer’s IT organization. The customer LAN must be able to handle instrument data and must have sufficient bandwidth for instrument acquisition (no overnight backups over the LAN).

![LAN configuration with existing customer network](image)

**Figure 4** LAN configuration with existing customer network
LAN Interface compatibility

The table below lists the minimum requirements for LAN operation with the LAN Interface.

**Table 1  LAN Compatibility**

LAN compatibility on early 1100 modules

All 1100 Series HPLC modules shipped prior to 1997 are NOT compatible with the LAN Interface communication. The modules which host the LAN Interface (usually the detector module) requires a new main board. The serial number break of the 1100 series modules and the part numbers for the new boards are listed below.

**Table 2  LAN compatibility on early 1100 modules**

In this chapter you will find instructions to help you to set-up your LAN Interface.

The information is based on the Agilent 1100 series HPLC modules, but can be easily transferred to the 8453 UV-vis spectrophotometer.
Installing and cabling the LAN Interface

What you will get

- G1369A LAN Interface
- LAN cables (for part numbers see “Repair and Parts Information” on page 44)

Patch-cable
Twisted pair Shielded 7 m
(5023-0202)

Patch-cable
Cross-over Shielded 3 m
(5023-0203)

CD-ROM with the manual

LAN Interface
(1369-60001)

Figure 5  What you will get (Content of G1369A)
What you have to do first

1. Remove the LAN Interface from its packaging.

**NOTE**
Use an ESD (Electro-Static Discharge) wrist strap when handling electronics. Refer to your instrument manual for details.

**Figure 6** Board Layout
2 Getting Started
Installing and cabling the LAN Interface

2 Note the MAC (Media Access Control) address for further reference. The MAC or hardware address of the LAN Interface is a world wide unique identifier. No other network device will have the same hardware address. The MAC address can be found on a label on the card (see Figure 6 on page 15).

![MAC-Label](image)

3 Turn off instrument line power or remove the power cord before installing the LAN Interface.

4 On your instrument, identify the option slot for the MIO accessory card.

5 Remove any blank cover plates and ensure that the slot is empty.

NOTE
If the module has the 1100 CAN modification board installed, it probably has a revision 1 mainboard and will not accept the LAN interface. Refer to “LAN Interface compatibility” on page 12

![Location of LAN Interface](image)
Getting Started  2
Installing and cabling the LAN Interface

NOTE
In 1100 systems, the LAN Interface should be installed in the detector (DAD, MWD, FLD, VWD) due to its higher data handling rate. If no 1100 detector available, use the pump or the autosampler (in this order).

NOTE
The LAN Interface is shipped with the Bootp initialization mode and will use the parameters (IP, Subnet Mask and Default Gateway addresses) from a Bootp server. If you need another initialization mode or other settings, refer to “Initialization mode selection” on page 20 for details before doing the next step.

6  Carefully slide the LAN Interface into the slot. Some pressure may be necessary to properly seat the board. Tighten the screws.

7  Disconnect your PC from the network and connect the PC network card to the instrument's LAN Interface using a Crossover Network cable (point-to-point) or alternatives, see page 10 and page 11.

CAUTION
Be careful that you connect the LAN cable to the LAN Interface and NOT one of the CAN connections. The CAN bus uses 12-Volt signals, and a misconnection to the CAN bus may destroy network equipment on the other end of the cable.

Figure 9  Connect the LAN cable to the correct connector
LAN Interface configuration

TCP/IP parameter configuration

To operate properly in a network environment, the LAN Interface must be configured with valid TCP/IP network parameters. These parameters are:

- IP address
- Subnet Mask
- Default Gateway

The TCP/IP parameters can be configured by the following methods:

- by automatically requesting the parameters from a network-based BOOTP Server (using the so-called Bootstrap Protocol)
- by manually setting the parameters using Telnet
- by manually setting the parameters using the Handheld Controller (G1323A/B)

The LAN Interface differentiates between several initialization modes. The initialization mode (short form ‘init mode’) defines how to determine the active TCP/IP parameters after power-on. The parameters may be derived from a Bootp cycle, non-volatile memory or initialized with known default values. The initialization mode is selected by the configuration switch, see Figure 10 on page 19.
**Configuration switches**

The configuration switches are mounted on the card, see Figure 10.

![Figure 10](image.png)

**Figure 10** Location of Configuration Switches

The LAN Interface is shipped with all switches set to OFF, as shown above.

**Table 3** Factory Default Settings

<table>
<thead>
<tr>

<td>OFF</td>
<td>ON</td>
<td>OFF</td>
<td>Using Stored</td>
</tr>
<tr>
<td>OFF</td>
<td>ON</td>
<td>ON</td>
<td>Using Default</td>
</tr>
</tbody>
</table>

**Bootp**

When the initialization mode “Bootp” is selected, the card tries to download the parameters from a Bootp Server. The parameters obtained become the active parameters immediately. They are not stored to the non-volatile memory of the card. Therefore, the parameters are lost with the next power cycle of the card.

![Bootp Server](image)

**Figure 11** Bootp (Principle)

**Bootp & Store**

When “Bootp & Store” is selected, the parameters obtained from a Bootp Server become the active parameters immediately. In addition, they are stored to the non-volatile memory of the card. Thus, after a power cycle they are still available. This enables a kind of “bootp once” configuration of the card.

Example: The user may not want to have a Bootp Server be active in his network all the time. But on the other side, he may not have any other configuration method than Bootp. In this case he starts the Bootp Server temporarily, powers on the card using the initialization mode “Bootp &Store”,

![Diagram](image)
waits for the Bootp cycle to be completed, closes the Bootp Server and powers off the card. Then he selects the initialization mode “Using Stored” and powers on the card again. From now on, he is able to establish the TCP/IP connection to the card with the parameters obtained in that single Bootp cycle.

Figure 12  Bootp & Store (Principle)

NOTE
Use the initialization mode “Bootp & Store” carefully, because writing to the non-volatile memory takes time. Therefore, when the card shall obtain its parameters from a Bootp Server every time it is powered on, the recommended initialization mode is “Bootp”!

Using Stored

When initialization mode “Using Stored” is selected, the parameters are taken from the non-volatile memory of the card. The TCP/IP connection will be established using these parameters. The parameters were configured previously by one of the described methods.

Figure 13  Using Stored (Principle)
Getting Started
LAN Interface configuration

Using Default

When “Using Default” is selected, the factory default parameters are taken instead. These parameters enable a TCP/IP connection to the LAN Interface without further configuration, see Table 5.

![Figure 14 Using Default (Principle)](image)

NOTE
Using the default address in your local area network may result in network problems. Take care and change it to a valid address immediately.

Table 5 Using Default Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address:</td>
<td>192.168.254.11</td>
</tr>
<tr>
<td>Subnet Mask:</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>not specified</td>
</tr>
</tbody>
</table>

Since the default IP address is a so-called local address, it will not be routed by any network device. Thus, the PC and the card must reside in the same subnet.

The user may open a Telnet session using the default IP address and change the parameters stored in the non-volatile memory of the card. He may then close the session, select the initialization mode “Using Stored”, power-on again and establish the TCP/IP connection using the new parameters.

When the card is wired to the PC directly (e.g. using a cross-over cable or a local hub), separated from the local area network, the user may simply keep the default parameters to establish the TCP/IP connection.

NOTE
In the “Using Default” mode, the parameters stored in the memory of the card are not cleared automatically. If not changed by the user, they are still available, when switching back to the mode “Using Stored”.

Link configuration selection

The LAN Interface supports 10 or 100 Mbps operation in full- or half-duplex modes. In most cases, full-duplex is supported when the connecting network device - such as a network switch or hub - supports IEEE 802.3u auto-negotiation specifications.

When connecting to network devices that do not support auto-negotiation, the LAN Interface will configure itself for 10- or 100-Mbps half-duplex operation.

For example, when connected to a non-negotiating 10-Mbps hub, the LAN Interface will be automatically set to operate at 10-Mbps half-duplex.

If the card is not able to connect to the network through auto-negotiation, you can manually set the link operating mode using link configuration switches on the card.

</tbody>
</table>
Automatic configuration with Bootp

When automatic configuration with Bootp is selected and the LAN Interface is powered on, it broadcasts a BOOTP (Bootstrap Protocol) request that contains its MAC (hardware) address. A BOOTP server daemon searches its database for a matching MAC address, and if successful, sends the corresponding configuration parameters to the card as a BOOTP reply. These parameters become the active TCP/IP parameters immediately and the TCP/IP connection can be established.

Configuring the CAG Bootp server program

1. The CAG Bootp Server program is placed in the start-up group and automatically is started during the boot process of the PC. It’s minimized and located in the task bar.

2. Open the Bootp Server window by clicking on it in the task bar.

3. Now turn on the module with the LAN Interface and view the Bootp Server window. After some time the Bootp Server will display the request from the LAN Interface with the hardware (MAC) address (this information is also stored in the file trace.txt in the bootp server directory, if Log to Disk is enabled), see Figure 15 on page 25.

NOTE
All examples shown in this chapter will not work in your environment. You need your own IP-, Subnet-Mask- and Gateway addresses.

NOTE
Assure that the LAN Interface configuration switch is set properly. The setting should be either Bootp or Bootp & Store, see Table 4 on page 20.

NOTE
Assure that the instrument with the LAN Interface installed and connected to the PC is powered off.

NOTE
If the CAG Bootp Server program is not already installed on your PC, then install it from your Agilent ChemStation CD-ROM, located in folder \Bootp.
The MAC or hardware address of the LAN Interface is a world wide unique identifier. No other network device will have the same hardware address.

The MAC address can be found on a label on the card, see Figure 6 on page 15.

4 Identify your LAN Interface by the MAC address, see Figure 15.

If you are working in a network system, you may see other LAN Interfaces appear, overwriting your LAN Interface information periodically.

5 Select Configure -> Add Entry to configure the Bootp Manager (Figure 17). The drop down box “MAC address” lists all MAC addresses found. Select your MAC address. If no hardware address is found, select Cancel and repeat step 3 and step 4.
2 Getting Started

Automatic configuration with Bootp

6 Specify the Host Name (LC1100-01), the IP address (134.40.24.230), the Comment (LC1100-01) and the Subnet Mask 255.255.248.0 and the Gateway (134.40.24.1).

NOTE If you are working in a network system, you need your own addresses. Contact your local IT group.

Figure 17 Add Bootp Entry - Enter your parameter

7 Exit with OK.

8 Select Configure -> Bootp Manager. All entries made above are shown in Figure 18 on page 27.
9 Press Apply to activate the changes.

10 Press OK to exit the Bootp Manager and power cycle the instrument with the LAN Interface, to force it to send a new bootp request again. This time, the MAC address will be recognized by the Bootp Server (Figure 19). It will send the configured IP address and subnet mask information which are necessary for communication to the LAN Interface.

**Figure 18**  Bootp Manager

**Figure 19**  Bootp Server - 1100 module found
2 Getting Started
Automatic configuration with Bootp

NOTE
When using this Bootp mode, the parameters are not written into the non-volatile memory of the card. If you delete this Bootp Configuration, the LAN Interface will show up as shown in Figure 15 on page 25 (Bootp mode).

If you want to store your parameters permanently on the card (for use without the CAG Bootp server), refer to “Storing the settings permanently with Bootp program” on page 29.
Storing the settings permanently with Bootp program

If you want to change parameters of the card using the Bootp follow the instructions below.

1. Turn off the module that hosts the LAN Interface and remove the card.
2. Change the card’s settings of the Configuration Switch to "Bootp & Store" mode, see Table 4 on page 20.
3. Install the LAN Interface.
4. Start the CAG Bootp Server program and open its window.
5. If required, modify the parameters for the LAN Interface according to your needs using the existing configuration.
6. Press OK to exit the Bootp Manager.
7. Now turn on the module with the LAN Interface and view the Bootp Server window. After some time the Bootp Server will display the request from the LAN Interface. The parameters are now stored permanently in the non-volatile memory of the card.
8. Close the CAG Bootp Server program and turn off the module and remove the LAN Interface.
9. Change the settings of the card’s Configuration Switch to “Using Stored” mode, see Table 4 on page 20.
10. Install the card and power cycle the module with the LAN Interface. The card can be accessed now via LAN without the CAG Bootp Server program, refer to “PC and Agilent ChemStation setup” on page 39.

NOTE

Use an ESD (Electro-Static Discharge) wrist strap when handling electronics. Refer to your instrument manual for details.
Manual configuration

Manual configuration only alters the set of parameters stored in the non-volatile memory of the card. It never affects the currently active parameters. Therefore, manual configuration can be done at any time. A power cycle is mandatory to make the stored parameters become the active parameters, given that the initialization mode selection switches are allowing it.

![Diagram of manual configuration principle](image-url)

**Figure 20** Manual Configuration (Principle)
With Telnet

Whenever a TCP/IP connection to the card is possible (TCP/IP parameters set by any method), the parameters may be altered by opening a Telnet session.

1. Open the system (DOS) prompt window by clicking on Windows START button and select “Run...”. Type “cmd” and press OK.

2. Type the following at the system (DOS) prompt:

   `c:\>telnet <IP address>`

   where `<IP address>` may be the assigned address from a Bootp cycle, a configuration session with the Handheld Controller (G1323A/B), or the default IP address (see “Configuration switches” on page 19).

When the connection was established successfully, the card responds with the following:

   ![Figure 21 - Telnet - Starting a session](image)

3. To change a parameter follows the style:

   `parameter value`

   for example: `ip 134.40.24.230`

   then press [Enter], where parameter refers to the configuration parameter you are defining, and value refers to the definitions you are assigning to that parameter. Each parameter entry is followed by a carriage return.

</tr>
</tbody>
</table>

**Figure 23** Telnet - Current settings in Bootp mode
5 Change the IP address (in this example 134.40.24.158) and type "/" to list current settings.

![Telnet - Change IP settings](image)

change of TCP/IP setting

Initialization mode is Bootp
The connected PC/Bootserver is 134.40.24.184

active TCP/IP settings

stored TCP/IP settings in non-volatile memory

last user change (not active yet, requires mode "Using Stored" and re-start)

Figure 24 Telnet - Change IP settings

6 When you have finished typing the configuration parameters, type:

```
quit and press [Enter] to store the configuration parameters
```

or

```
exit and press [Enter] to exit without storing parameters.
```

If the Initialization Mode Switch is changed now to “Using Stored” mode, the instrument will take the stored settings when the module is re-booted. In the example above it would be 194.40.24.158 on QUIT and 194.40.24.160 on EXIT.
With Handheld Controller

To configure the TCP/IP parameters before connecting the card to the network, the Handheld Controller (G1323B with firmware B.02.02 or above for 1100 series modules only, see LAN Interface compatibility 12.) can be used.

1. Press F5 “Views”, select “System” and press the “Enter” key.
2. Press F2 “Configure”, select the module where the LAN Interface is installed and press the “Enter” key (Figure 25).

![Figure 25 Select module](image)

3. Press F1 “Interfaces”, select “MIO” and press the “Enter” key (Figure 26).

![Figure 26 Select MIO](image)
4 A Warning message shall pop up. Press “Continue” (Figure 27).

![Warning message](image)

**Figure 27** Warning message

5 After the Handheld Controller was reading out the LAN Interface you will get an overview of all the parameters that are set in the card (LAN Interface Status Page). The information corresponds to the information in Figure 23 on page 32.

![LAN Interface Status Page](image)

**Figure 28** LAN Interface Status Page

In Figure 29 on page 36 the complete listing is shown. For explanations refer to Figure 23 on page 32.

Figure 29   LAN Interface Status Page (complete)

6 To change the TCP/IP settings, press F1 “Service”.

Figure 30   Entering the Service Mode
Figure 31  TCP/IP parameters

7 Move to the parameter you want to change, enter the new value and press “Enter”.

Figure 32  Service
8 If you completed your changes, press “Done” to leave the Service section.
9 Press F6 “Done” and restart the module by pressing “OK”.

PC and Agilent ChemStation setup

PC Setup for Local Configuration

This procedure describes the change of the TCP/IP settings on your PC to match the LAN Interface default parameters in a local configuration (see also “Local configuration using cross-over cable” on page 10 and “Using Default” on page 22).

![Image showing the TCP/IP settings of the PC]

**Figure 34** Changing the TCP/IP settings of the PC
2  Getting Started
PC and Agilent ChemStation setup

Agilent ChemStation setup

1  Start the Configuration Editor of the Agilent ChemStation.

![Figure 35](image)

2  Add a TCP/IP connection to communicate with the LAN Interface. Use the IP address of the LAN Interface.

![Figure 35](image)

NOTE
If using a corporate LAN, IP addresses need to be supplied by the responsible IT department. Also the LAN needs to be able to handle additional traffic.

3  Save the configuration, close the Configuration Editor and start the Agilent ChemStation.

Getting Help

Troubleshooting 42
Link Status LEDs 42
Error Messages 43
Repair and Parts Information 44
Agilent Support Information 45
Firmware Update 45
Reporting of Problems 45
Agilent Web 45
Glossary 46

In this chapter you will find support information about troubleshooting, repair and the Agilent web.
If the LAN Interface does not successfully connect to the network, there are several ways to get status information from the card.

### Link Status LEDs

On the card, near the RJ-45 connector, two status LEDs are mounted. See Figure 36.

![Status LEDs](image)

**Figure 36** Status LEDs

The LED named “Speed” shows the actual link speed.

**Table 8** LED “Speed”

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>off</td>
<td>link speed 10 Mbps</td>
</tr>
<tr>
<td>on</td>
<td>link speed 100 Mbps</td>
</tr>
</tbody>
</table>

The LED named “Activity” shows whether the physical link is established or not. In addition, it shows whether the card is transferring data or not.

**Table 9** LED “Activity”

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>off</td>
<td>no physical link established</td>
</tr>
<tr>
<td>on</td>
<td>physical link established</td>
</tr>
<tr>
<td>blinking</td>
<td>transferring data</td>
</tr>
</tbody>
</table>
Error Messages

The error messages are shown in the LAN Interface Status Page on the Control Module (G1323A/B) only, refer to “With Handheld Controller” on page 34.

Agilent Technologies G1369A
FW Revision   : A.01.01
MAC Address   : 0030d3060122
--------------------------------
Init Mode     : Bootp
--------------------------------
TCP/IP Properties
- active -
IP Address    : 0.0.0.0
Subnet Mask   : not specified
Def. Gateway  : not specified
- stored -
IP Address    : 134.40.24.160
Subnet Mask   : 255.255.248.0
Def. Gateway  : 134.40.24.1
--------------------------------
TCP/IP Status : Error
Bootp timeout
--------------------------------
Controller    : not connected

Possible reasons:
Bootp server not started or no settings for this MAC address found

Figure 37   LAN Interface Status Page (complete)

If status "Error" shows up, possible error conditions are listed below.

<table>
<thead>
<tr>
<th>Table 10</th>
<th>Error conditions</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error</td>
<td>Description</td>
<td>Action</td>
</tr>
<tr>
<td>Bootp timeout</td>
<td>No reply on Bootp request received</td>
<td>Start Bootp server and/or add settings for the LAN Interface.</td>
</tr>
<tr>
<td>Bootp reply incomplete</td>
<td>Bootp reply contained not all information</td>
<td>Complete the necessary information</td>
</tr>
<tr>
<td>Gateway in unreachable network</td>
<td>Default Gateway does not match the specified IP address and Subnet Mask</td>
<td>Correct the settings</td>
</tr>
</tbody>
</table>
The repair level of the product Agilent G1369A LAN Interface is replacement of the complete board.

Agilent Support Information

Firmware Update

The LAN Interface’s firmware can be updated, using the firmware provided by the Agilent support web side, see "Agilent Web". A procedure will be provided with the firmware.

Reporting of Problems

If the LAN Interface shows problems in your system report it with the following information (from the MAC-Label, see Figure 8 on page 16):

- Part number of the LAN Interface
- Board Revision Code, Vendor, Year and Week of assembly
- MAC address
- Installed firmware revision (if known or still accessible, see Figure 23 on page 32 or Figure 37 on page 43).

Agilent Web

Latest documentation or firmware updates for this product (Agilent G1369A LAN Interface) can be obtained from the Agilent web side

http://www.agilent.com

> Life Sciences/Chemical Analysis

For firmware select “Technical Support", then look for “Firmware for LC & LC/MS”

For manual select “Library", then search for G1369A and “manual”
### Glossary

<table>
<thead>
<tr>
<th>Term / Acronym</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100Base-TX</td>
<td>Twisted pair Ethernet cable.</td>
</tr>
<tr>
<td>Bootp</td>
<td>Bootstrap Protocol, an Internet protocol that enables a diskless workstation to discover its own IP address</td>
</tr>
<tr>
<td>CAN</td>
<td>Controller Area Network; a shared broadcast bus, which runs at speeds up to 1Mbit/sec; it is a serial data communications bus for real-time applications.</td>
</tr>
<tr>
<td>CAG</td>
<td>Chemical Analysis Group (Agilent term)</td>
</tr>
<tr>
<td>DOS</td>
<td>Disk Operating System. The term DOS can refer to any operating system, but it is most often used as a shorthand for MS-DOS (Microsoft disk operating system).</td>
</tr>
<tr>
<td>ESD</td>
<td>Electrostatic discharge, the rapid discharge of static electricity from one conductor to another of a different potential. An electrostatic discharge can damage integrated circuits</td>
</tr>
<tr>
<td>Ethernet</td>
<td>A local area network (LAN) specified as IEEE 802.3</td>
</tr>
<tr>
<td>Gateway</td>
<td>A node on a network that serves as an entrance to another network.</td>
</tr>
<tr>
<td>HP-IB or GP-IB</td>
<td>The IEEE-488 Interface Bus (HP-IB) or general purpose interface bus (GP-IB) was developed to provide a means for various instruments and devices to communicate with each other under the direction of one or more master controllers. The HP-IB was originally intended to support a wide range of instruments and devices, from the very fast to the very slow.</td>
</tr>
<tr>
<td>IP address</td>
<td>An identifier for a computer or device on a TCP/IP network.</td>
</tr>
<tr>
<td>Host</td>
<td>A computer system that is accessed by a user working at a remote location.</td>
</tr>
<tr>
<td>Hub</td>
<td>Is some kind of router, which allows clients to connect each other.</td>
</tr>
<tr>
<td>LAN</td>
<td>Lab Area Network</td>
</tr>
</tbody>
</table>
LED Light Emitting Diode

MAC address Media Access Control address, a hardware address that uniquely identifies each node of a network.

MIO Modular Input/Output; interface specification from Hewlett-Packard

RJ-45 connector Registered Jack-45, an eight-wire connector used commonly to connect computers onto a local-area networks (LAN), especially Ethernets. RJ-45 connectors look similar to the RJ-11 connectors used for connecting telephone equipment, but they are somewhat wider.

Subnet Mask A mask used to determine what subnet an IP address belongs to. Subnetting enables the network administrator to further divide the host part of the address into two or more subnets.

TCP/IP Transmission Control Protocol/Internet Protocol; LAN (Ethernet) protocol

Telnet A terminal emulation program for TCP/IP networks such as the Internet.
3 Getting Help

Glossary
In This Book

This guide contains information to install the LAN Interface (G1369A).

- Introduction - Around your LAN Interface
