Software Revision
This guide is valid for A.01.xx revisions of the Agilent G1369C LAN Interface Card software, where xx refers to minor revisions of the software that do not affect the technical accuracy of this guide.

Warranty
The material contained in this document is provided “as is,” and is subject to being changed, without notice, in future editions. Further, to the maximum extent permitted by applicable law, Agilent disclaims all warranties, either express or implied, with regard to this manual and any information contained herein, including but not limited to the implied warranties of merchantability and fitness for a particular purpose. Agilent shall not be liable for errors or for incidental or consequential damages in connection with the furnishing, use, or performance of this document or of any information contained herein. Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Technology Licenses
The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

Restricted Rights Legend
If software is for use in the performance of a U.S. Government prime contract or subcontract, Software is delivered and licensed as “Commercial computer software” as defined in DFAR 252.227-7014 (June 1995), or as a “commercial item” as defined in FAR 2.101(a) or as “Restricted computer software” as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies’ standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

Safety Notices

CAUTION
A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING
A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.
In This Guide...

This guide contains information to install the LAN Interface Card (G1369C).

1 Introduction - Around your LAN Interface Card

In this chapter you will find an introduction to the LAN Interface Card and its function.

2 Getting Started

In this chapter you will find instructions to help you to set-up your LAN Interface Card based on the Agilent 1100/1200/1260 series HPLC modules.

3 Getting Help

In this chapter you will find support information about troubleshooting, repair and the Agilent web.

1 Introduction - Around your LAN Interface Card

In this chapter you will find an introduction to the LAN Interface Card and its function.
Introduction to the LAN Interface Card

The LAN Interface Card (Local Area Network) is the Agilent replacement for the previously used Agilent G1369A/B LAN Interface Card or HP JetDirect card in the Agilent 1100/1200/1260 series HPLC modules, the 8453 UV-vis spectrophotometer, the 35900E A/D converter and the 6850 Series GC.

</tr>
</tbody>
</table>

NOTE

Compared to the G1369A LAN Card, SW 7 and SW 8 must be always in OFF position on the G1369B/C LAN Card, otherwise the selected modes are not working. See “Configuration Switches” on page 21.

LAN Control - What Exactly Does It Do?

In its simplest form...

• control of your instrument and acquires data “remotely” from your desktop (easier access),
• a direct replacement for GP-IB (HP-IB) interface protocol,
• allows your instrument to be placed anywhere on the laboratory/corporate network,
• improves lab “ergonomics” (better organization),
LAN Interface Card - What Has To Be Done?

- install LAN Interface Card into the instrument
- install network interface card (NIC) into PC (if not already pre-installed or on-board).
- connect to instrument
  - direct with cross-over cable or
  - to HUB with twisted pair cable
- configure instrument on LAN
LAN Control Configurations

The basic LAN configurations are shown below.

**Local Configuration Using Cross-over Cable**

The simplest way is a configuration with a single system.

![Local configuration using cross-over cable](image)

**LAN Using a HUB and Twisted Pair Cables**

More complicated setup than direct cross-over connection.

![LAN configuration using a HUB and twisted pair cables](image)
LAN With Existing Customer Network

Use MDI/MDI-X port or “Cascade” Port with standard twisted pair cable to connect Hub to a “parent” hub. IP Addresses and other TCP/IP configuration information MUST be provided by the customer’s IT organization. The customer LAN must be able to handle instrument data and must have sufficient bandwidth for instrument acquisition (no overnight backups over the LAN).

![LAN configuration with existing customer network](image)

**Figure 4**  LAN configuration with existing customer network
LAN Interface Card Compatibility

The table below lists the minimum requirements for LAN operation with the LAN Interface Card.

**Table 2  LAN Compatibility**

LAN Compatibility On Early 1100 Modules

All 1100 Series HPLC modules shipped prior to 1997 are NOT compatible with the LAN Interface communication. The modules which host the LAN Interface (usually the detector module) requires a new main board. The serial number break of the 1100 series modules and the part numbers for the new boards are listed below.

If an Agilent detector is part of the LC System, the LAN Interface Card should be inserted in the detector module.

Installing and Cabling the LAN Interface Card

What You Will Get

- G1369C LAN Interface Card
- LAN cables
- Manual on CD-Rom

Figure 5  What you will get (Content of G1369C/G1369-60012)
What You Have To Do First

Electronic boards and components are sensitive to electrostatic discharge (ESD). ESD can damage electronic boards and components.

- Be sure to hold the board by the edges and do not touch the electrical components. Always use an ESD protection (for example, an ESD wrist strap) when handling electronic boards and components.

1. Remove the LAN Interface Card from its packaging.

Figure 6  Board Layout G1369C
2 Getting Started
Installing and Cabling the LAN Interface Card

2 Note the MAC (Media Access Control) address for further reference. The MAC or hardware address of the LAN Interface Card is a world wide unique identifier. No other network device will have the same hardware address. The MAC address can be found on a label on the card (see Figure 6 on page 17).

Part number of the LAN Interface Card, see page 56
Revision Code, Vendor, Year and Week of assembly
MAC address
Country of Origin

Figure 7 MAC-Label

3 Turn off instrument line power or remove the power cord before installing the LAN Interface Card.

4 On your instrument, identify the option slot for the MIO accessory card.

5 Remove any blank cover plates and ensure that the slot is empty.

NOTE

If the module has the 1100 CAN modification board installed, it probably has a revision 1 mainboard and will not accept the LAN interface. Refer to “LAN Interface Card Compatibility” on page 13

Figure 8 Location of LAN Interface Card (e.g. 1100/1200 series detector)
In 1100/1200/1260/1290 systems, the LAN Interface Card should be installed in the detector (DAD, MWD, FLD, VWD, RID) due to its higher data handling rate. If no 1100/1200/1260 detector available, use the pump or the autosampler (in this order).

The LAN Interface Card is shipped with the Bootp initialization mode and will use the parameters (IP, Subnet Mask and Default Gateway addresses) from a Bootp server. If you need another initialization mode or other settings, refer to “Initialization Mode Selection” on page 22 for details before doing the next step.

6 Carefully slide the LAN Interface Card into the slot. Some pressure may be necessary to properly seat the board. Tighten the screws.

7 Disconnect your PC from the network and connect the PC network card to the instrument's LAN Interface Card using a Crossover Network cable (point-to-point) or alternatives, see page 11 and page 12.

Be careful that you connect the LAN cable to the LAN Interface Card and NOT one of the CAN connections. The CAN bus uses 12-Volt signals, and a misconnection to the CAN bus may destroy network equipment on the other end of the cable.
LAN Interface Card Configuration

TCP/IP Parameter Configuration

To operate properly in a network environment, the LAN Interface Card must be configured with valid TCP/IP network parameters. These parameters are:

- IP address
- Subnet Mask
- Default Gateway

The TCP/IP parameters can be configured by the following methods:

- by automatically requesting the parameters from a network-based DHCP Server (using the so-called Dynamic Host Configuration Protocol)
- by automatically requesting the parameters from a network-based BOOTP Server (using the so-called Bootstrap Protocol)
- by manually setting the parameters using Telnet
- by manually setting the parameters using the Agilent Instant Pilot (G4208A)
- by manually setting the parameters using the Handheld Controller (G1323A/B)

The LAN Interface Card differentiates between several initialization modes. The initialization mode (short form ‘init mode’) defines how to determine the active TCP/IP parameters after power-on. The parameters may be derived from a Bootp cycle, non-volatile memory or initialized with known default values. The initialization mode is selected by the configuration switch, see Figure 10 on page 21.
**Configuration Switches**

The board is sensitive for electrostatic discharge (ESD). See CAUTION on page 17.

The configuration switches are mounted on the card, see Figure 10.

![Figure 10](image)

**Figure 10** Location of Configuration Switches

The LAN Interface Card is shipped with all switches set to OFF, as shown above.

### Table 4 Factory Default Settings

<table>
<thead>
<tr>

<td>DHCP</td>
</tr>
</tbody>
</table>

**NOTE** Compared to the G1369A LAN Card, SW 7 and SW 8 must be always in OFF position on the G1369B/C LAN Card, otherwise the selected modes are not working.

**Bootp**

When the initialization mode “Bootp” is selected, the card tries to download the parameters from a Bootp Server. The parameters obtained become the active parameters immediately. They are not stored to the non-volatile memory of the card. Therefore, the parameters are lost with the next power cycle of the card.

![Figure 11  Bootp (Principle)]
Bootp & Store

When “Bootp & Store” is selected, the parameters obtained from a Bootp Server become the active parameters immediately. In addition, they are stored to the non-volatile memory of the card. Thus, after a power cycle they are still available. This enables a kind of “bootp once” configuration of the card.

Example: The user may not want to have a Bootp Server be active in his network all the time. But on the other side, he may not have any other configuration method than Bootp. In this case he starts the Bootp Server temporarily, powers on the card using the initialization mode “Bootp &Store”, waits for the Bootp cycle to be completed, closes the Bootp Server and powers off the card. Then he selects the initialization mode “Using Stored” and powers on the card again. From now on, he is able to establish the TCP/IP connection to the card with the parameters obtained in that single Bootp cycle.

![Diagram of Bootp & Store](image)

**Figure 12**  Bootp & Store (Principle)

**NOTE**

Use the initialization mode “Bootp & Store” carefully, because writing to the non-volatile memory takes time. Therefore, when the card shall obtain its parameters from a Bootp Server every time it is powered on, the recommended initialization mode is “Bootp”!
Using Stored

When initialization mode “Using Stored” is selected, the parameters are taken from the non-volatile memory of the card. The TCP/IP connection will be established using these parameters. The parameters were configured previously by one of the described methods.

![Diagram of Non-Volatile RAM and Active Parameter]

**Figure 13**  Using Stored (Principle)

Using Default

When “Using Default” is selected, the factory default parameters are taken instead. These parameters enable a TCP/IP connection to the LAN Interface Card without further configuration, see Table 6.

![Diagram of Default Parameter and Active Parameter]

**Figure 14**  Using Default (Principle)

**NOTE**
Using the default address in your local area network may result in network problems. Take care and change it to a valid address immediately.

**Table 6**  Using Default Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>IP address:</td>
<td>192.168.254.11</td>
</tr>
<tr>
<td>Subnet Mask:</td>
<td>255.255.255.0</td>
</tr>
<tr>
<td>Default Gateway</td>
<td>not specified</td>
</tr>
</tbody>
</table>
Since the default IP address is a so-called local address, it will not be routed by any network device. Thus, the PC and the card must reside in the same subnet.

The user may open a Telnet session using the default IP address and change the parameters stored in the non-volatile memory of the card. He may then close the session, select the initialization mode “Using Stored”, power-on again and establish the TCP/IP connection using the new parameters.

When the card is wired to the PC directly (e.g. using a cross-over cable or a local hub), separated from the local area network, the user may simply keep the default parameters to establish the TCP/IP connection.

**NOTE**

In the “Using Default” mode, the parameters stored in the memory of the card are not cleared automatically. If not changed by the user, they are still available, when switching back to the mode “Using Stored”.

**DHCP**

When the initialization mode “DHCP” is selected, the card tries to download the parameters from a DHCP Server. The parameters obtained become the active parameters immediately. They are not stored to the non-volatile memory of the card.

Beside requesting the network parameters, the card also submits its hostname to the DHCP Server. The hostname equals the MAC address of the card, e.g. "0030d3177321". It is the DHCP server's responsibility to forward the hostname/address information to the Domain Name Server. The card does not offer any services for hostname resolution (e.g. NetBIOS).

---

**Figure 15**   DHCP (Principle)
NOTE

DHCP Servers may reject the hostname proposed by the card.
Link Configuration Selection

The LAN Interface Card supports 10 or 100 Mbps operation in full- or half-duplex modes. In most cases, full-duplex is supported when the connecting network device - such as a network switch or hub - supports IEEE 802.3u auto-negotiation specifications.

When connecting to network devices that do not support auto-negotiation, the LAN Interface Card will configure itself for 10- or 100-Mbps half-duplex operation.

For example, when connected to a non-negotiating 10-Mbps hub, the LAN Interface Card will be automatically set to operate at 10-Mbps half-duplex.

If the card is not able to connect to the network through auto-negotiation, you can manually set the link operating mode using link configuration switches on the card.

Table 7  Link Configuration Switches

</tr>
</tbody>
</table>

**NOTE**  Compared to the G1369A LAN Card, SW 7 and SW 8 must be always in OFF position on the G1369B/B LAN Card, otherwise the selected modes are not working.
Automatic Configuration with Bootp

When automatic configuration with Bootp is selected and the LAN Interface Card is powered on, it broadcasts a BOOTP (Bootstrap Protocol) request that contains its MAC (hardware) address. A BOOTP server daemon searches its database for a matching MAC address, and if successful, sends the corresponding configuration parameters to the card as a BOOTP reply. These parameters become the active TCP/IP parameters immediately and the TCP/IP connection can be established.

Configuring the Agilent Bootp Service Program

**NOTE**
All examples shown in this chapter will not work in your environment. You need your own IP-, Subnet-Mask- and Gateway addresses.

**NOTE**
Assure that the detector configuration switch is set properly. The setting should be either Bootp or Bootp & Store, see Table 5 on page 22.

**NOTE**
Assure that the detector connected to the network is powered off.

**NOTE**
If the Agilent Bootp Service program is not already installed on your PC, then install it from your Agilent ChemStation DVD, located in folder \Bootp.
1 The Agilent Bootp Service is placed in the start-up group and automatically is started during the boot process of the PC.

2 Open the Bootp Settings window (Figure 16) and enter the default settings for your setup.

![Bootp Settings](image)

**Figure 16** Bootp Service Settings

3 Launch the Manager. It will open the Bootp Manager screen, see Figure 17. This shows all network hardware that has been added (initially empty).

![Bootp Manager](image)

**Figure 17** Bootp Manager
4 Select Add to enter the module specific information, see Figure 18:

- MAC address (from label on the instrument)
- host name
- IP address
- comment (instrument name / location)
- subnet mask (if different)
- gateway (if required)

Figure 18  Bootp Manager - Enter your parameter
5 Press OK. The parameter are added to the Bootp Manager, see Figure 18 and added to the TabFile, see Figure 16 on page 29:

![Bootp Manager](image)

**Figure 19**  Bootp Manager - check your entries

6 Press Exit Manager and OK to exit the Agilent Bootp Service.

7 Now turn on the module with the detector, wait about 30-60 seconds and view the LogFile, see Figure . It should display the request from the detector with the hardware (MAC) address.

```
02/03/05 16:33:56 PM

Status: Reply to BOOTP Request has been sent
Status: BOOTP Request finished processing at outer most layer

LogFile - the detector has received the parameter
```
Getting Started
Automatic Configuration with Bootp

NOTE
When using this Bootp mode, the parameters are not written into the non-volatile memory of the detector. If you delete this Bootp Configuration, the Bootp Manager will show up as shown in Figure 17 on page 29 (Bootp mode).

If you want to store your parameters permanently on the detector (for use without the Agilent Bootp service), refer to “Storing the Settings Permanently with Bootp Program” on page 37.

Configuring the CAG Bootp Server Program

NOTE
All examples shown in this chapter will not work in your environment. You need your own IP-, Subnet-Mask- and Gateway addresses.

NOTE
Assure that the LAN Interface Card configuration switch is set properly. The setting should be either Bootp or Bootp & Store, see Table 5 on page 22.

NOTE
Assure that the instrument with the LAN Interface Card installed and connected to the PC is powered off.

NOTE
If the CAG Bootp Server program is not already installed on your PC, then install it from your Agilent ChemStation CD-ROM, located in folder \Bootp.

1 The CAG Bootp Server program is placed in the start-up group and automatically is started during the boot process of the PC. It's minimized and located in the task bar.

2 Open the Bootp Server window by clicking on it in the task bar.

3 Now turn on the module with the LAN Interface Card and view the Bootp Server window. After some time the Bootp Server will display the request from the LAN Interface Card with the hardware (MAC) address (this information is also stored in the file trace.txt in the bootp server directory, if Log to Disk is enabled), see Figure 20 on page 33.

The MAC or hardware address of the LAN Interface Card is a world wide unique identifier. No other network device will have the same hardware address.
The MAC address can be found on a label on the card, see Figure 6 on page 17.

![Bootp Server](image)

**Figure 20** Bootp Server

4 Identify your LAN Interface Card by the MAC address, see **Figure 20**.

![Add Bootp Entry](image)

**Figure 21** Add Bootp Entry - Select the MAC address

If you are working in a network system, you may see other LAN Interfaces appear, overwriting your LAN Interface Card information periodically.

5 Select *Configure -> Add Entry* to configure the Bootp Manager (**Figure 22**). The drop down box “MAC address” lists all MAC addresses found. Select your MAC address. If no hardware address is found, select *Cancel* and repeat step 3 and step 4.
2 Getting Started
Automatic Configuration with Bootp

6 Specify the Host Name (LC1100-01), the IP address (134.40.24.230), the Comment (LC1100-01) and the Subnet Mask 255.255.248.0 and the Gateway (134.40.24.1).

NOTE If you are working in a network system, you need your own addresses. Contact your local IT group.

Figure 22 Add Bootp Entry - Enter your parameter

7 Exit with OK.

8 Select Configure -> Bootp Manager. All entries made above are shown in Figure 23 on page 35.
9 Press *Apply* to activate the changes.

10 Press *OK* to exit the Bootp Manager and power cycle the instrument with the LAN Interface Card, to force it to send a new bootp request again. This time, the MAC address will be recognized by the Bootp Server (Figure 24). It will send the configured IP address and subnet mask information which are necessary for communication to the LAN Interface Card.

**Figure 23** Bootp Manager

**Figure 24** Bootp Server - module found
2 Getting Started
Automatic Configuration with Bootp

NOTE When using this Bootp mode, the parameters are not written into the non-volatile memory of the card. If you delete this Bootp Configuration, the LAN Interface will show up as shown in Figure 20 on page 33 (Bootp mode).

If you want to store your parameters permanently on the card (for use without the CAG Bootp server), refer to “Storing the Settings Permanently with Bootp Program” on page 37.
Storing the Settings Permanently with Bootp Program

If you want to change parameters of the card using the Bootp follow the instructions below.

Use an ESD (Electro-Static Discharge) wrist strap when handling electronics. Refer to your instrument manual for details.

1. Turn off the module that hosts the LAN Interface Card and remove the card.

2. Change the card’s settings of the Configuration Switch to ”Bootp & Store” mode, see Table 5 on page 22.

3. Install the LAN Interface Card.

4. Start the CAG Bootp Server program and open its window.

5. If required, modify the parameters for the LAN Interface Card according to your needs using the existing configuration.

6. Press OK to exit the Bootp Manager.

7. Now turn on the module with the LAN Interface Card and view the Bootp Server window. After some time the Bootp Server will display the request from the LAN Interface Card. The parameters are now stored permanently in the non-volatile memory of the card.

8. Close the CAG Bootp Server program and turn off the module and remove the LAN Interface Card.

9. Change the settings of the card’s Configuration Switch to “Using Stored” mode, see Table 5 on page 22.

10. Install the card and power cycle the module with the LAN Interface Card. The card can be accessed now via LAN without the CAG Bootp Server program, refer to “PC and Agilent ChemStation Setup” on page 49.
Manual Configuration

Manual configuration only alters the set of parameters stored in the non-volatile memory of the card. It never affects the currently active parameters. Therefore, manual configuration can be done at any time. A power cycle is mandatory to make the stored parameters become the active parameters, given that the initialization mode selection switches are allowing it.

![Diagram of Manual Configuration](image)

**Figure 25**  Manual Configuration (Principle)
With Telnet

Whenever a TCP/IP connection to the card is possible (TCP/IP parameters set by any method), the parameters may be altered by opening a Telnet session.

1. Open the system (DOS) prompt window by clicking on Windows START button and select “Run...”. Type “cmd” and press OK.

2. Type the following at the system (DOS) prompt:

   c:\>telnet <IP address>

   ![Telnet - Starting a session](image)

   where <IP address> may be the assigned address from a Bootp cycle, a configuration session with the Agilent Instant Pilot (G4208A) or Handheld Controller (G1323A/B), or the default IP address (see “Configuration Switches” on page 21).

   When the connection was established successfully, the card responds with the following:

   ![A connection to the module is made](image)

3. To change a parameter follows the style:

   parameter value

   for example: ip 134.40.24.230
then press [Enter], where parameter refers to the configuration parameter you are defining, and value refers to the definitions you are assigning to that parameter. Each parameter entry is followed by a carriage return.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>?</td>
<td>displays syntax and descriptions of commands</td>
</tr>
<tr>
<td>/</td>
<td>displays current settings</td>
</tr>
<tr>
<td>ip &lt;x.x.x.x&gt;</td>
<td>sets new ip address</td>
</tr>
<tr>
<td>sn &lt;x.x.x.x&gt;</td>
<td>set new subnet mask</td>
</tr>
<tr>
<td>gw &lt;x.x.x.x&gt;</td>
<td>sets new default gateway</td>
</tr>
<tr>
<td>quit</td>
<td>saves changes and exit shell</td>
</tr>
<tr>
<td>exit</td>
<td>exits shell without saving changes</td>
</tr>
</tbody>
</table>

Any time during the Telnet session you can type “?” then press [Enter] to view available configuration parameters, the correct command format, and a list of additional commands to display.
4 Use the “/” and press Enter to list the current settings.

Information about the card
Product id, firmware revision (A.xx.xx are released versions), MAC address, initialization mode

Initialization mode is Bootp
The connected PC/Bootserver is 134.40.24.184

Active TCP/IP settings

Stored TCP/IP settings in non-volatile memory (not visible if equal to active TCP/IP settings)
Connected to PC with controller software (e.g. Agilent ChemStation), here not connected

5 Change the IP address (in this example 134.40.24.158) and type “/” to list current settings.

Change of TCP/IP setting

Initialization mode is Bootp
The connected PC/Bootserver is 134.40.24.184

Active TCP/IP settings

Stored TCP/IP settings in non-volatile memory

Last user change (not active yet, requires mode “Using Stored” and re-start)
6 When you have finished typing the configuration parameters, type:

`quit` and press [Enter] to store the configuration parameters

or

`exit` and press [Enter] to exit without storing parameters.

If the Initialization Mode Switch is changed now to “Using Stored” mode, the instrument will take the stored settings when the module is re-booted. In the example above it would be 134.40.24.158 on QUIT and 134.40.24.160 on EXIT.
With Agilent Instant Pilot

To configure the TCP/IP parameters before connecting the detector to the network, the Instant Pilot (G4208A) can be used.

1. From the Welcome screen press the More button.
2. Select Configure.
3. Press the DAD (MWD) button.
4. Scroll down to the LAN settings.

5. Press the Edit button, perform the required changes and press the Done button.
6. Leave the screen by pressing the Exit button.
With Handheld Controller G1323B

The module screenshots in this section are taken with the G1369B LAN Interface card. Therefore the displayed product number and firmware revision is different.

To configure the TCP/IP parameters before connecting the card to the network, the Handheld Controller (G1323B with firmware B.02.02 or above for 1100/1200 series modules only, see “LAN Interface Card Compatibility” on page 13) can be used.

1. Press F5 “Views”, select “System” and press the “Enter” key.
2. Press F2 “Configure”, select the module where the LAN Interface Card is installed and press the “Enter” key (Figure 31).

![Figure 31](image)

**Figure 31** Select module
3 Press F1 “Interfaces”, select “MIO” and press the “Enter” key (Figure 32).

![Image of Config interface with MIO selected]

**Figure 32** Select MIO

4 A Warning message shall pop up. Press “Continue” (Figure 33).

![Image of Warning message pop-up]

**Figure 33** Warning message

5 After the Handheld Controller was reading out the LAN Interface Card you will get an overview of all the parameters that are set in the card...
(LAN Interface Card Status Page). The information corresponds to the information in Figure 28 on page 41.

![LAN Interface Card Status Page](image)

**Figure 34** LAN Interface Card Status Page

In Figure 35 on page 46 the complete listing is shown. For explanations refer to Figure 28 on page 41.

Agilent Technologies G1369C  
FW Revision : B.06.40 0003  
MAC Address : 0030d31b8417

Init Mode : Bootp

TCP/IP Properties
- active -
  IP Address : 0.0.0.0
  Subnet Mask : not specified
  Def. Gateway : not specified
- stored -
  IP Address : 134.40.24.160
  Subnet Mask : 255.255.248.0
  Def. Gateway : 134.40.24.1

TCP/IP Status : Error
Bootp timeout

Controller : not connected

**Figure 35** LAN Interface Card Status Page (complete)
To change the TCP/IP settings, press F1 “Service”.

![Figure 36](image1.png) Entering the Service Mode

![Figure 37](image2.png) TCP/IP parameters
7 Move to the parameter you want to change, enter the new value and press “Enter”.

![Figure 38 Service](image)

8 If you completed your changes, press “Done” to leave the Service section.

9 Press F6 “Done” and restart the module by pressing “OK”.

![Figure 39 Re-boot screen](image)
PC and Agilent ChemStation Setup

PC Setup for Local Configuration

This procedure describes the change of the TCP/IP settings on your PC to match the LAN Interface Card default parameters in a local configuration (see also “Local Configuration Using Cross-over Cable” on page 11 and “Using Default” on page 24).

Figure 40  Changing the TCP/IP settings of the PC
Agilent ChemStation Setup

1. Start the Configuration Editor of the Agilent ChemStation.

![Figure 41](image1.png) Changing the TCP/IP settings of the Agilent ChemStation

2. Add a TCP/IP connection to communicate with the LAN Interface Card. Use the IP address of the LAN Interface Card.

   ![Figure 41](image2.png)

**NOTE**

If using a corporate LAN, IP addresses need to be supplied by the responsible IT department. Also the LAN needs to be able to handle additional traffic.

3. Save the configuration, close the Configuration Editor and start the Agilent ChemStation.
**Hosted Module Support**

The G1369C LAN Interface Card is able to host a so-called Agilent Hosted Module (e.g. Universal Valve Drive, G1170A). This functionality can be used when the HPLC system does not include a module with integrated LAN interface (G4212A/B DAD, G4220A/B Pump, G1315/65C/D, G1314D/E/F VWD). To make use of the hosting functionality, just connect the provided CAN cable between the LAN card's CAN port and one of the instrument's CAN ports, see Figure 42 on page 51.

**NOTE**

A standard Agilent HPLC module without integrated LAN interface does not support Hosted Modules.
How to connect hosted modules

- All modules must be on the same FW level (A/B/C.06.32 or A/B/C.06.50 or later). No mixed revisions possible! See additional information in section “Firmware Update” on page 58.
- Install the G1369C LAN Card in a module with LAN card slot (preferentially a detector, e.g. G1314C).

NOTE
In 1100/1200/1260/1290 systems, the LAN Interface Card should be installed in the detector (DAD, MWD, FLD, VWD, RID) due to its higher data handling rate. If no 1100/1200/1260 detector available, use the pump or the autosampler (in this order).

- Establish a CAN connection between G1369C LAN card and the module which holds the LAN card.
- Connect the hosted module to a free CAN connector in the stack.
- Maximum 3 hosted modules can be connected to the stack.

![Diagram of How to connect hosted modules](image)

**Figure 43** How to connect hosted modules
In this chapter you will find support information about troubleshooting, repair and the Agilent web.
Troubleshooting

If the LAN Interface Card does not successfully connect to the network, there are several ways to get status information from the card.

**Link Status LEDs**

On the card, near the RJ-45 connector, two status LEDs are mounted. See Figure 44.

![Status LEDs](image)

**Figure 44**  Status LEDs

The LED named “Speed” shows the actual link speed.

<table>
<thead>
<tr>
<th>Table 9  LED “Speed”</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED off</td>
</tr>
<tr>
<td>LED on</td>
</tr>
</tbody>
</table>

The LED named “Activity” shows whether the physical link is established or not. In addition, it shows whether the card is transferring data or not.

<table>
<thead>
<tr>
<th>Table 10  LED “Activity”</th>
</tr>
</thead>
<tbody>
<tr>
<td>LED off</td>
</tr>
<tr>
<td>LED on</td>
</tr>
<tr>
<td>LED blinking</td>
</tr>
</tbody>
</table>
Error Messages

The error messages are shown in the LAN Interface Card Status Page on the Control Module (G1323A/B) only, refer to “With Handheld Controller G1323B” on page 44.

Firmware Update

The LAN Interface Card’s firmware can be updated, using the firmware provided by the Agilent support web side. A procedure will be provided with the firmware.

Initial firmware revision: B.06.40 (for “Hosted Module Support” on page 51)

Updates may be required in case the “Hosted Module Support” on page 51 requires an update (only when this feature is used). For normal LAN operation firmware changes may not be required.

For the G1369C LAN card a more convenient firmware update mechanism is available that replaces the old Telnet procedure. Please refer to the LAN/RS-232 Firmware Updated Tool (version 2.9 or later).

**WARNING**

Do not load G1369C firmware on a G1369B card! The G1369B card will become inoperable.

---

**Update Procedure**

1. Download the actual firmware from the Agilent web
2. The zipped firmware archive contains all required files and the procedure for the update.
3. Follow the provided instructions.
Agilent Support Information

Reporting of Problems

If the LAN Interface Card shows problems in your system report it with the following information (from the MAC-Label, see Figure 8 on page 18):

- Part number of the LAN Interface Card
- Board Revision Code, Vendor, Year and Week of assembly
- MAC address
- Installed firmware revision (if known or still accessible, see Figure 28 on page 41 or Figure 45 on page 55).

Agilent Web

Latest documentation or firmware updates for this product (Agilent G1369C LAN Interface Card) can be obtained from the Agilent web side http://www.agilent.com

> Life Sciences/Chemical Analysis

For firmware select “Technical Support”, then look for “Firmware for LC & LC/MS”

For manual select “Library”, then search for G1369C and “manual”
## Glossary

### Table 13  Glossary

<table>
<thead>
<tr>
<th>Term / Acronym</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>10/100Base-TX</td>
<td>Twisted pair Ethernet cable.</td>
</tr>
<tr>
<td>Bootp</td>
<td>Bootstrap Protocol, an Internet protocol that enables a diskless workstation to discover its own IP address</td>
</tr>
<tr>
<td>CAN</td>
<td>Controller Area Network; a shared broadcast bus, which runs at speeds up to 1Mbit/sec; it is a serial data communications bus for real-time applications.</td>
</tr>
<tr>
<td>CAG</td>
<td>Chemical Analysis Group (Agilent term)</td>
</tr>
<tr>
<td>DOS</td>
<td>Disk Operating System. The term DOS can refer to any operating system, but it is most often used as a shorthand for MS-DOS (Microsoft disk operating system).</td>
</tr>
<tr>
<td>ESD</td>
<td>Electrostatic discharge, the rapid discharge of static electricity from one conductor to another of a different potential. An electrostatic discharge can damage integrated circuits</td>
</tr>
<tr>
<td>Ethernet</td>
<td>A local area network (LAN) specified as IEEE 802.3</td>
</tr>
<tr>
<td>Gateway</td>
<td>A node on a network that serves as an entrance to another network.</td>
</tr>
<tr>
<td>HP-IB or GP-IB</td>
<td>The IEEE-488 Interface Bus (HP-IB) or general purpose interface bus (GP-IB) was developed to provide a means for various instruments and devices to communicate with each other under the direction of one or more master controllers. The HP-IB was originally intended to support a wide range of instruments and devices, from the very fast to the very slow.</td>
</tr>
<tr>
<td>IP address</td>
<td>An identifier for a computer or device on a TCP/IP network.</td>
</tr>
<tr>
<td>Host</td>
<td>A computer system that is accessed by a user working at a remote location.</td>
</tr>
