Should Agilent and the user have a separate written agreement with warranty terms covering the material in this document that conflict with these terms, the warranty terms in the separate agreement shall control.

Technology Licenses

The hardware and/or software described in this document are furnished under a license and may be used or copied only in accordance with the terms of such license.

Restricted Rights Legend

If software is for use in the performance of a U.S. Government prime contract or sub-contract, Software is delivered and licensed as “Commercial computer software” as defined in DFAR 252.227-7014 (June 1995), or as a “commercial item” as defined in FAR 2.101(a) or as “Restricted computer software” as defined in FAR 52.227-19 (June 1987) or any equivalent agency regulation or contract clause. Use, duplication or disclosure of Software is subject to Agilent Technologies’ standard commercial license terms, and non-DOD Departments and Agencies of the U.S. Government will receive no greater than Restricted Rights as defined in FAR 52.227-19(c)(1-2) (June 1987). U.S. Government users will receive no greater than Limited Rights as defined in FAR 52.227-14 (June 1987) or DFAR 252.227-7015 (b)(2) (November 1995), as applicable in any technical data.

Safety Notices

CAUTION

A CAUTION notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in damage to the product or loss of important data. Do not proceed beyond a CAUTION notice until the indicated conditions are fully understood and met.

WARNING

A WARNING notice denotes a hazard. It calls attention to an operating procedure, practice, or the like that, if not correctly performed or adhered to, could result in personal injury or death. Do not proceed beyond a WARNING notice until the indicated conditions are fully understood and met.
In This Book

This manual covers the Agilent 1290 Infinity II Multicolumn Thermostat (G7116B).

1 Introduction to the Multicolumn Thermostat
This chapter gives an introduction to the MCT and an instrument overview.

2 Site Requirements and Specifications
This chapter provides information on environmental requirements, physical and performance specifications.

3 Using the Module
This chapter gives instructions on how to use the module.

4 Preparing the Module
This chapter provides information on how to set up the module for an analysis and explains the basic settings.

5 Optimization
This chapter provides information on how to optimize the Multi Column Thermostat.

6 Troubleshooting and Diagnostics
Overview about the troubleshooting and diagnostic features.

7 Error Information
This chapter describes the meaning of error messages, and provides information on probable causes and suggested actions how to recover from error conditions.
In This Book

8 Test Functions and Calibrations
   This chapter describes the module's built in test functions.

9 Maintenance
   This chapter describes the maintenance of the MCT.

10 Parts and Materials for Maintenance
   This chapter provides information on parts for maintenance.

11 Identifying Cables
   This chapter provides information on cables used with the Agilent 1200 Infinity Series modules.

12 Hardware Information
   This chapter describes the module in more detail on hardware and electronics.

13 Appendix
   This chapter provides addition information on safety, legal and web.

Operating Principle 24

This chapter gives an introduction to the MCT and an instrument overview.
Product Description (G7116B)

The Agilent 1290 Infinity II Multicolumn Thermostat (MCT) allows precise column thermostatting over a broad temperature range: from cooling down to 20 degrees below ambient temperature up to 110 °C, providing high flexibility for optimized speed and selectivity of LC separation.

Ultrahigh pressure valves enable a wide range of applications such as column selection from 8 columns in a single MCT, sample preparation for analyte enrichment or matrix removal, alternating column regeneration, etc.

The MCT fits with all 1290 Infinity II modules and can also be combined with modules of the Agilent 1260 and 1290 Infinity Series.

Figure 1  Overview of the Multicolumn Thermostat
Features (G7116B)

- Superior usability with flexible flap positions: open door to 90° (desk function), 180° or even remove door for accessibility.
- Efficient, fast and convenient column exchange through new quick-connect fittings.
- Advanced column capacity for up to 8 columns in a single MCT.
- New Quick-Connect Heat Exchanger for pre-column solvent thermostatting – easily mounted for each of up to 8 columns and optimized for low internal volume contribution.
- High application flexibility through Peltier cooling and heating with two independent temperature zones from 20 degree below ambient up to 110 °C.
- Optional valve drive for use of Quick-Change high pressure valves.
- High temperature precision for reproducible retention times and peak areas.
Column Switching Valve (Optional)

Multicolumn Selection (G7116B with G4239C)

Advantages

- Increase productivity
- Higher instrument up-time

The valve facilitating quick changes allows the selection between up to eight different stationary phases for a variety of applications, or the usage of identical stationary phases in columns with different dimensions for either faster run-times (short columns) or higher resolution (long columns) or for loading studies with different internal diameters.

Figure 2 The G7116B 1290 Infinity II Series Multiple Column Thermostat equipped with a Quick-Change 8 Column Selector Valve
Method Development

Advantages:

- Faster method development
- Automated method development possible

Figure 3  Totally different chromatographic results by using the same sample but three different stationary phases
Typical Applications

NOTE

The interconnection of ports at particular valve position strongly depends on the combination of valve and module. The software user interface always displays the correct situation. A method modification or re-plumbing of the connections is typically required if transferring methods from G1316A/B/C to G7116A/B, G1170A or G4227A.

Refer to the table below for further information on which ports are connected to which position.

Dual column selection (2pos/6port or 2pos/10port valves)

Advantages:
- Increase productivity
- Higher instrument up-time

The valve can select either column 1 or column 2, allowing quick changes between two different stationary phases for separation selectivity, or immediate availability of a second and identical stationary phase in case the first column loses efficiency, when dealing with complex matrices for instance.
Introduction to the Multicolumn Thermostat

Typical Applications

Sample enrichment and sample cleanup (2pos/6port or 2pos/10port valves)

Sample Enrichment

Position 1-6

Sample Cleanup

Position 1-6

Advantages:

- Easy automation of sample preparation
- Higher reproducibility
- Increased productivity and sensitivity
Sample cleanup is essential for samples with complex matrices, such as biological fluids, food extracts and waste water. Before injection into a LC or LC/MS system, the sample matrix must be separated from the analytes of interest. Otherwise, contaminants can disrupt separation and detection or even damage the analytical column.

**Enrichment methods**

Enrichment methods are the technique of choice to obtain highest sensitivity and to remove the sample matrix in such applications as proteomics, drug metabolism and environmental trace analysis. The analytes are retained and concentrated onto the pre-column, while the sample matrix is passed to waste. After the valve switch, a second pump backflushes the analytes out of the pre-column onto the separation column. This allows injection of large volumes onto the pre-column, significantly expanding sensitivity in the range of ten to several thousands.

**Stripping methods**

Stripping methods handle analytes and matrices in the opposite way to enrichment methods. Matrix components are retained on the pre-column while the analytes pass through to the separation column. After the valve switches, an additional pump backflushes the matrix components out of the pre-column to waste, while the analytes are separated on the main column. Backflushing prepares the pre-column for the next injection.
Alternating Column Regeneration (2pos/10port valves only)

Advantages:
- High sample throughput
- Increased productivity
- High efficiency

Gradient elution is frequently used for fast separation of complex samples in LC. Since the gradient elution requires the column to regenerate before subsequent runs, an automated column regeneration system saves valuable analysis time. Agilent’s 1200 Infinity Quick-Change 2-position/10-port valve enables the simultaneous analysis of one sample on one LC column while a second, identical column is flushed and equilibrated by an additional regeneration pump. At the end of the run, the valve switches to the second position and the next sample is separated on the previously flushed and equilibrated column, while the first column is now flushed and equilibrated by the regeneration pump. Up to 50% of analysis time is often required to equilibrate columns. Using alternating column regeneration saves time and provides higher sample throughput.
Leak and Waste Handling

The Agilent InfinityLab LC Series has been designed for safe leak and waste handling. It is important that all security concepts are understood and instructions are carefully followed.

The solvent cabinet is designed to store a maximum volume of 8 L solvent. The maximum volume for an individual bottle stored in the solvent cabinet should not exceed 2 L. For details, see the usage guideline for the Agilent 1200 Infinity Series Solvent Cabinets (a printed copy of the guideline has been shipped with the solvent cabinet, electronic copies are available on the Internet).

All leak plane outlets are situated in a consistent position so that all Infinity and Infinity II modules can be stacked on top of each other. Waste tubes are guided through a channel on the right hand side of the instrument, keeping the front access clear from tubes.

The leak plane provides leak management by catching all internal liquid leaks, guiding them to the leak sensor for leak detection, and passing them on to the next module below, if the leak sensor fails. The leak sensor in the leak plane stops the running system as soon as the leak detection level is reached.

Solvent and condensate is guided through the waste channel into the waste container:

- from the detector's flow cell outlet
- from the Multisampler needle wash port
- from the Sample Cooler (condensate)
- from the Seal Wash Sensor
- from the pump's Purge Valve or Multipurpose Valve
1 Introduction to the Multicolumn Thermostat

Leak and Waste Handling

Figure 4 Infinity II Leak Waste Concept (flexible rack installation)
Figure 5  Infinity II Single Stack Leak Waste Concept (bench installation)
Figure 6    Infinity II Two Stack Leak Waste Concept (bench installation)

The waste tube connected to the leak pan outlet on each of the bottom instruments guides the solvent to a suitable waste container.
Waste Concept

1. Agilent recommends using the 6 L waste can with 1 Stay Safe cap GL45 with 4 ports (5043-1221) for optimal and safe waste disposal. If you decide to use your own waste solution, make sure that the tubes don't immerse in the liquid.
Operating Principle

The Concept of Heating and Cooling

The design of the multi-column thermostat (MCT) uses Quick-Connect Heat Exchangers that are mounted on to the heating and cooling devices with peltier-elements. The solvent entering the Quick-Connect Heat Exchangers is heated up or cooled down to a settable temperature before entering the column. A triangular shape of the Quick-Connect Heat Exchangers avoids incorrect placement and verifies optimum temperature exchange of the column. Optimum isolation of the heater room offers best temperature stability for the column. This ensures that the column and the solvent flowing through it are almost at the same temperature. The solvent cools down or heats up on its transfer from the Quick-Connect Heat Exchangers to the column inlet. This depends on several factors: flow rate, setpoint temperature, ambient temperature and column dimensions. Any type of heated column compartment brings one important consequence for column temperature equilibration. Before an equilibrium is reached, the whole mass of column, column packing, and solvent volume inside the column has to be brought to the selected temperature. This depends on several factors: flow rate, setpoint temperature.
temperature, ambient temperature and column dimensions. The higher the flow rate, the faster the column equilibrates (due to thermostatted mobile phase). In a flow-through temperature regulation system, there are necessarily slightly different temperatures at different positions. The actual temperature displayed on the user interface is always the temperature taken at the heating and cooling device.

The equilibration of the column may take a while. Stability of the pressure signal is a good indication for temperature equilibrium of the column.
Introduction to the Multicolumn Thermostat

Operating Principle
This chapter provides information on environmental requirements, physical and performance specifications.
Site Requirements

A suitable environment is important to ensure optimal performance of the instrument.

Power Considerations

The module power supply has wide ranging capability. It accepts any line voltage in the range described in Table 1 on page 31. Consequently there is no voltage selector in the rear of the module. There are also no externally accessible fuses, because automatic electronic fuses are implemented in the power supply.

**WARNING**

Hazard of electrical shock or damage of your instrumentation can result, if the devices are connected to a line voltage higher than specified.

➔ Connect your instrument to the specified line voltage only.

**WARNING**

The module is partially energized when switched off, as long as the power cord is plugged in.

Repair work at the module can lead to personal injuries, e.g. electrical shock, when the cover is opened and the module is connected to power.

➔ Always unplug the power cable before opening the cover.

➔ Do not connect the power cable to the instrument while the covers are removed.

**WARNING**

Inaccessible power plug.

In case of emergency it must be possible to disconnect the instrument from the power line at any time.

➔ Make sure the power connector of the instrument can be easily reached and unplugged.

➔ Provide sufficient space behind the power socket of the instrument to unplug the cable.
Power Cords

Country-specific power cords are available for the module. The female end of all power cords is identical. It plugs into the power-input socket at the rear. The male end of each power cord is different and designed to match the wall socket of a particular country or region.

Agilent makes sure that your instrument is shipped with the power cord that is suitable for your particular country or region.

**WARNING**

**Absence of ground connection**

The absence of ground connection can lead to electric shock or short circuit.

➔ Never operate your instrumentation from a power outlet that has no ground connection.

**WARNING**

**Unintended use of supplied power cords**

Using power cords for unintended purposes can lead to personal injury or damage of electronic equipment.

➔ Never use a power cord other than the one that Agilent shipped with this instrument.

➔ Never use the power cords that Agilent Technologies supplies with this instrument for any other equipment.

➔ Never use cables other than the ones supplied by Agilent Technologies to ensure proper functionality and compliance with safety or EMC regulations.

**WARNING**

**Power cords**

Solvents may damage electrical cables.

➔ Prevent electrical cables from getting in contact with solvents.

➔ Exchange electrical cables after contact with solvents.
2 Site Requirements and Specifications

Site Requirements

Bench Space

The module dimensions and weight (see Table 1 on page 31) allow you to place the module on almost any desk or laboratory bench. It needs an additional 2.5 cm (1.0 inches) of space on either side and approximately 8 cm (3.1 inches) in the rear for air circulation and electric connections.

If the bench shall carry a complete HPLC system, make sure that the bench is designed to bear the weight of all modules.

The module should be operated in a horizontal position.

NOTE

Agilent recommends that you install the HPLC instrument in the A-Line Flex Bench rack. This option helps to save bench space as all modules can be placed into one single stack. It also allows to easily relocate the instrument to another Lab.

Condensation

CAUTION

Condensation within the module

Condensation can damage the system electronics.

➔ Do not store, ship or use your module under conditions where temperature fluctuations could cause condensation within the module.

➔ If your module was shipped in cold weather, leave it in its box and allow it to warm slowly to room temperature to avoid condensation.

Extended Specifications

The G7116B MCT is delivered with Low Dispersion Heat Exchanger (0.12 mm with 1.6 μL delay volume) that is suitable for standard applications.

Additional flavors of Heater Exchangers are available for optimization regarding better heating performance at higher flow rates (>2.5 mL) or for reducing the dispersion volume for low flow applications.
2 Site Requirements and Specifications

Extended Specifications
This chapter gives instructions on how to use the module.
Magnets

1. This stack exemplarily shows the magnets' positions in the modules.
Turn on/off

1

3
Status Indicators

1. The module status indicator indicates one of six possible module conditions:

   Status indicators
   1. Idle
   2. Run mode
   3. Not-ready. Waiting for a specific pre-run condition to be reached or completed.
   4. Error mode - interrupts the analysis and requires attention (for example a leak or defective internal components).
   5. Resident mode (blinking) - for example during update of main firmware.
   6. Bootloader mode (fast blinking). Try to re-boot the module or try a cold-start. Then try a firmware update.
Open the Front Door

The front door opens in two angles: 90° and 180°. In the 90° position it can be used as a tray.

1. Press the release button to open the front door.
2. Open the door in a 90° angle to use it as a tray.
3 Using the Module
Install Heat Exchanger

Install Heat Exchanger

For bio-inert modules use bio-inert parts only!

Preparations

- Heat exchanger(s) installed in MCT
- Column holder clip(s) installed to heater block on top of Heat exchanger(s)
- Column inlet capillary connected to heat exchanger outlet
Remove a column

1. Disconnect the A-Line Quick Turn Fitting.
2. Disconnect the A-Line Quick Turn Fitting.
3. Open the lever of the A-Line Quick Connect Fitting.
4. Unscrew and remove the Quick Connect Fitting.
Install a column

1. Connect the Column Inlet Capillary using the A-Line Quick Connect Fitting.
2. Turn the Column onto the Quick Connect Fitting until it is finger tight.
3. Close the lever to make a pressure tight connection.
4. Connect the Capillary to detector to the Column Outlet using the A-Line Quick Turn Fitting.
5. Use a wrench to counter the column while tightening the capillary fitting.
6. Position the Column into the Column Holder Clip(s).
7. Configure the column. For further information see Agilent Information Center or the online help of your CDS.
Installing Valve Heads

The valve drives are factory-installed in the Multicolumn Thermostat. The valve heads are interchangeable and can be easily mounted.

At the first installation, the transportation lock and the dummy valve have to be removed, see “Remove the Transportation Lock and the Valve Dummy” on page 48. The valve heads can be installed by mounting the valve heads onto the valve drives and fastening the nut manually (do not use any tools).

Be sure that the guide pin snaps into the groove of the valve drive thread.

NOTE

The valves are mounted on pull-out rails to allow easy installation of capillaries. Push the valve gently into its housing until it snaps into the inner position, push it again and it slides out.

When all capillaries are installed, push the valve back into its housing, see “Install the Valve Head and Connect Capillaries” on page 50.

Remove the Transportation Lock and the Valve Dummy

The following procedure demonstrates the necessary steps for installing the valve head to the valve drive of a Multicolumn Thermostat (MCT).

For the installation of a valve head to a G1170A Infinity Valve Drive you can ignore the steps that describe the MCT features of the transportation lock and spring loaded valve drive.
### Installing Valve Heads

1. Switch off the module.

2. When unscrewing the transportation lock, push it back until the last screw is removed - the valve rail is spring-loaded.

3. Press on the valve dummy (1.) to release it (2.) (spring-loaded valve rail).

4. 

5. 

---

**Images:**
- Switching off the module.
- Un螺丝ing the transportation lock.
- Pressing on the valve dummy.
- Release of the valve rail.
Install the Valve Head and Connect Capillaries

For bio-inert modules use bio-inert parts only!

**CAUTION**
The valve actuator contains sensitive optical parts, which need to be protected from dust and other pollutions. Pollution of these parts can impair the accurate selection of valve ports and therefore bias measurement results.

➔ Always install a valve head for operation and storage. For protecting the actuator, a dummy valve head can be used instead of a functional valve. Do not touch parts inside the actuator.

**CAUTION**
Column Damage or Bias Measurement Results
Switching the valve to a wrong position can damage the column or bias measurement results.

➔ Fit the lobe to the groove to make sure the valve is switched to the correct position.

**CAUTION**
Valve Damage
Using a low pressure valve on the high pressure side can damage the valve.

➔ When using multiple column compartments as part of a method development solution, make sure that the high pressure valve head is connected to the autosampler and the low pressure valve head is connected to the detector.

**CAUTION**
Sample degradation and contamination of the instrument
Metal parts in the flow path can interact with the bio-molecules in the sample leading to sample degradation and contamination.

➔ For bio-inert applications, always use dedicated bio-inert parts, which can be identified by the bio-inert symbol or other markers described in this manual.

➔ Do not mix bio-inert and non-inert modules or parts in a bio-inert system.
For a correct installation of the valve head, the outside pin (red) must completely fit into the outside groove on the valve drive’s shaft (red). A correct installation is only possible if the two pins (green and blue) on the valve head fit into their corresponding grooves on the valve drive’s actuator axis. Their match depends on the diameter of the pin and groove.

The tag reader reads the valve head properties from the valve head RFID tag during initialization of the module. Valve properties will not be updated, if the valve head is replaced while the module is on. Selection of valve port positions can fail, if the instrument does not know the properties of the installed valve.

To allow correct valve identification, power off the valve drive for at least 10 s.

For firmware requirements see Information on new RFID Tag Assembly Version Technical Note (01200-90130) which is included to each valve head.
The following procedure shows the valve head installation with an G7116 (MCT) module as an example. For other modules it is similar.

1. Insert the valve head into the valve shaft.

**OR**

If the outside pin does not fit into the outside groove, you have to turn the valve head until you feel that the two pins snap into the grooves. Now you should feel additional resistance from the valve drive while continuously turning the valve head until the pin fits into the groove.

2. When the outer pin is locked into the groove, manually screw the nut onto the valve head.

**NOTE**

Fasten the nut manually. Do not use any tools.
3. Install all required capillary connections to the valve.

4. Push the valve head until it snaps in and stays in the rear position.

5. Power on or power-cycle your module, so the valve head gets recognized during module initialization.
3 Using the Module
Installing the capillaries

Installing the capillaries

The 2pos/10port valve can be used here in the same way as a 2pos/6port valve; just follow the re-routing diagram below.

Map the ports from the 2pos/6port valve to the corresponding ports of the 2pos/10port valve according to the red arrows. For example, mount the capillary connected to port 6 (2pos/6port) at port 2 instead.

Connect port 1 and port 8 with a 120 mm length capillary. Plug plastic fittings into ports 9 and 10.

![Diagram of capillary connections]

NOTE Use outmost care to avoid any void volumes caused by poor connections.

1 Install the capillaries.

NOTE Use outmost care to avoid any void volumes caused by poor connections.

2 Connect the capillaries connected directly to a column and fasten them immediately with a spanner.

3 Finger-tighten all remaining capillaries.

4 Clip the unions into the corresponding clips of the low dispersion heat exchangers.
5 Fasten all fittings with a spanner.

6 Starting from position one through six (ten, respectively), fasten the fittings on the heat exchanger.

7 Fasten all fittings on attached modules (autosampler, detector, additional pumps). Fit all unused valve ports with a plastic plug.

8 Push the valves into the rear positions.

9 Place the capillaries that go to another module or waste into the capillary guides to prevent squeezing them when closing the front cover.

10 Stow any excess lengths of the capillaries.

11 Perform a final leak-check.
## Install the Divider Assembly

### Parts required

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>G7116-60006</td>
<td>Divider Assembly MCT</td>
</tr>
</tbody>
</table>

**NOTE**

The Divider Assembly must be installed if different temperatures are used on the right and the left heater element to separate these two temperature zones.

1. Push the rear part of the Divider Assembly into position (1.) and fix it with the screw (2.).
2. Install the valve head if used. See “Replace Valve Heads” on page 107.
3. Install all capillaries and heat exchangers required. For details refer to Install Heat Exchanger, and Exchange a Column (“Install Heat Exchanger” on page 42, “Exchange a Column” on page 45).
4. Install the front part of the Divider Assembly by putting it on top.
5. The front plate should be flush with the top and the bottom edge of the MCT housing.
Installing and Using Column ID Tags

Install the Column Identification Option

<table>

<td>Column ID Kit Right</td>
</tr>
<tr>
<td></td>
<td>5067-5917</td>
<td>Column ID TAG Assembly</td>
</tr>
</tbody>
</table>

Preparations

Power off the instrument.

**CAUTION**

Electronic boards and components are sensitive to electrostatic discharge (ESD).

ESD can damage electronic boards and components.

Be sure to hold the column ID modules by the plastic parts, and do not touch the electrical components. Do not touch the pins of the flex-board connector.

1. Remove any tube guides and tube clip holders that may already be installed on the sides of the MCT cover.
2. Unlock the left and right (G7116B only) side cover inserts by pushing them to the rear and put them aside.
### Installing and Using Column ID Tags

3. **Identify the left and right (G7116B only) column ID module.** The ID sockets 1 to 4 are numbered from top to bottom.

4. **Take the end of the pre-installed flex-board connector out of the holder.**

5. **Open the locking mechanism of the connector by lifting up the frame.**

6. **Push in the cable with the contacts facing to the rear.**

7. **Close the locking mechanism.**

8. **Verify that the cable is properly attached to the connector without visible offset.** Repeat steps 5 to 7 if necessary.
### Using the Module

**Installing and Using Column ID Tags**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>9</td>
<td>Attach the column ID module to the MCT cover.</td>
</tr>
<tr>
<td>10</td>
<td>Repeat steps 4 to 9 for the column ID module on the other side (if applicable).</td>
</tr>
<tr>
<td>11</td>
<td>Install the waste tube clip holder (example shows a G7116B).</td>
</tr>
</tbody>
</table>
### Connecting the Column ID Tags

1. If the column has no Column ID Tag, fit a tag by slipping the loop over one end of the column and pulling it tight through the plastic holder. Once the loop has been pulled tight, the tag can no longer be removed from the column.

2. Install the column in the module.

3. Plug the free end of the Column ID Tag into the adjacent socket in the column tag reader unit.

**NOTE**

It is essential that the Column ID Tag is plugged into the correct socket. Otherwise, the column tag information will not be correctly updated.

**NOTE**

If you have a full-length column, we recommend that you use the adjacent socket on the left column tag reader.
4
Preparing the Module

Leak and Waste Handling  62
Waste Concept  63
Solvent Information  64

This chapter provides information on how to set up the module for an analysis and explains the basic settings.
4 Preparing the Module
Leak and Waste Handling

Leak and Waste Handling

**WARNING** Toxic, flammable and hazardous solvents, samples and reagents

The handling of solvents, samples and reagents can hold health and safety risks.

➔ When working with these substances observe appropriate safety procedures (for example by wearing goggles, safety gloves and protective clothing) as described in the material handling and safety data sheet supplied by the vendor, and follow good laboratory practice.

➔ Do not use solvents with an auto-ignition temperature below 200 °C (392 °F). Do not use solvents with a boiling point below 56 °C (133 °F).

➔ Avoid high vapor concentrations. Always keep the temperature in the sample compartment at least 25 K below the boiling point of the solvent used.

➔ Do not operate the instrument in an explosive atmosphere.

➔ Reduce the volume of substances to the minimum required for the analysis.

➔ Never exceed the maximum permissible volume of solvents (8 L) in the solvent cabinet. Do not use bottles that exceed the maximum permissible volume as specified in the usage guideline for solvent cabinet.

➔ Ground the waste container.

➔ Regularly check the filling level of the waste container. The residual free volume in the waste container must be large enough to collect the waste liquid.

➔ To achieve maximal safety, regularly check the tubing for correct installation.

**NOTE**

For details, see the usage guideline for the solvent cabinet. A printed copy of the guideline has been shipped with the solvent cabinet, electronic copies are available in the Agilent Information Center or via the Internet.

For details on correct installation, see separate installation documentation.
**Waste Concept**

1. Agilent recommends using the 6 L waste can with 1 Stay Safe cap GL45 with 4 ports (5043-1221) for optimal and safe waste disposal. If you decide to use your own waste solution, make sure that the tubes don't immerse in the liquid.
Solvent Information

Observe the following recommendations on the use of solvents.

- Follow recommendations for avoiding the growth of algae, see pump manuals.
- Small particles can permanently block capillaries and valves. Therefore, always filter solvents through 0.22 μm filters.
- Avoid or minimize the use of solvents that may corrode parts in the flow path. Consider specifications for the pH range given for different materials like flow cells, valve materials etc. and recommendations in subsequent sections.

Material Information

Materials in the flow path are carefully selected based on Agilent’s experiences in developing highest quality instruments for HPLC analysis over several decades. These materials exhibit excellent robustness under typical HPLC conditions. For any special condition, please consult the material information section or contact Agilent.

Disclaimer

Subsequent data were collected from external resources and are meant as a reference. Agilent cannot guarantee the correctness and completeness of such information. Data is based on compatibility libraries, which are not specific for estimating the long-term life time under specific but highly variable conditions of UHPLC systems, solvents, solvent mixtures and samples. Information can also not be generalized due to catalytic effects of impurities like metal ions, complexing agents, oxygen etc. Apart from pure chemical corrosion, other effects like electro corrosion, electrostatic charging (especially for non-conductive organic solvents), swelling of polymer parts etc. need to be considered. Most data available refers to room temperature (typically 20 – 25 °C, 68 – 77 °F). If corrosion is possible, it usually accelerates at higher temperatures. If in doubt, please consult technical literature on chemical compatibility of materials.
PEEK

PEEK (Polyether-Ether Ketones) combines excellent properties regarding biocompatibility, chemical resistance, mechanical and thermal stability. PEEK is therefore the material of choice for UHPLC and biochemical instrumentation.

It is stable in the specified pH range (for the Bio-inert LC system: pH 1 – 13, see bio-inert module manuals for details), and inert to many common solvents.

There is still a number of known incompatibilities with chemicals such as chloroform, methylene chloride, THF, DMSO, strong acids (nitric acid > 10 %, sulphuric acid > 10 %, sulfonic acids, trichloroacetic acid), halogenes or aqueous halogene solutions, phenol and derivatives (cresols, salicylic acid etc.).

When used above room temperature, PEEK is sensitive to bases and various organic solvents, which can cause it to swell. Under such conditions normal PEEK capillaries are very sensitive to high pressure. Therefore Agilent uses stainless-steel cladded PEEK capillaries in bio-inert systems. The use of stainless steel cladded PEEK capillaries keeps the flow path free of steel and ensures pressure stability to at least 600 bar. If in doubt, consult the available literature about the chemical compatibility of PEEK.

Polyimide

Agilent uses semi-crystalline polyimide for rotor seals in valves and needle seats in autosamplers. One supplier of polyimide is DuPont, which brands polyimide as Vespel, which is also used by Agilent.

Polyimide is stable in a pH range between 1 and 10 and in most organic solvents. It is incompatible with concentrated mineral acids (e.g. sulphuric acid), glacial acetic acid, DMSO and THF. It is also degraded by nucleophilic substances like ammonia (e.g. ammonium salts in basic conditions) or acetates.

Polyethylene (PE)

Agilent uses UHMW (ultra-high molecular weight)-PE/PTFE blends for yellow piston and wash seals, which are used in 1290 Infinity pumps and for normal phase applications in 1260 Infinity pumps.

Polyethylene has a good stability for most common inorganic solvents including acids and bases in a pH range of 1 to 12.5. It is compatible to many
organic solvents used in chromatographic systems like methanol, acetonitrile and isopropanol. It has limited stability with aliphatic, aromatic and halogenated hydrocarbons, THF, phenol and derivatives, concentrated acids and bases. For normal phase applications, the maximum pressure should be limited to 200 bar.

**Tantalum (Ta)**

Tantalum is inert to most common HPLC solvents and almost all acids except fluoric acid and acids with free sulfur trioxide. It can be corroded by strong bases (e.g. hydroxide solutions > 10 %, diethylamine). It is not recommended for the use with fluoric acid and fluorides.

**Stainless Steel (ST)**

Stainless steel is inert against many common solvents. It is stable in the presence of acids and bases in a pH range of 1 to 12.5. It can be corroded by acids below pH 2.3. It can also corrode in following solvents:

- Solutions of alkali halides, their respective acids (for example, lithium iodide, potassium chloride, and so on) and aqueous solutions of halogens.
- High concentrations of inorganic acids like nitric acid, sulfuric acid and organic solvents especially at higher temperatures (replace, if your chromatography method allows, by phosphoric acid or phosphate buffer which are less corrosive against stainless steel).
- Halogenated solvents or mixtures which form radicals and/or acids, for example:
  
  \[
  2 \text{CHCl}_3 + \text{O}_2 \rightarrow 2 \text{COCl}_2 + 2 \text{HCl}
  \]

  This reaction, in which stainless steel probably acts as a catalyst, occurs quickly with dried chloroform if the drying process removes the stabilizing alcohol.
- Chromatographic grade ethers, which can contain peroxides (for example, THF, dioxane, di-isopropylether). Such ethers should be filtered through dry aluminium oxide which adsorbs the peroxides.
- Solutions of organic acids (acetic acid, formic acid, and so on) in organic solvents. For example, a 1 % solution of acetic acid in methanol will attack steel.
- Solutions containing strong complexing agents (for example, EDTA, ethylene diamine tetra-acetic acid).
- Mixtures of carbon tetrachloride with 2-propanol or THF.
Titanium (Ti)

Titanium is highly resistant to oxidizing acids (for example, nitric, perchloric and hypochlorous acid) over a wide range of concentrations and temperatures. This is due to a thin oxide layer on the surface, which is stabilized by oxidizing compounds. Non-oxidizing acids (for example, hydrochloric, sulfuric and phosphoric acid) can cause slight corrosion, which increases with acid concentration and temperature. For example, the corrosion rate with 3 % HCl (about pH 0.1) at room temperature is about 13 μm/year. At room temperature, titanium is resistant to concentrations of about 5 % sulfuric acid (about pH 0.3). Addition of nitric acid to hydrochloric or sulfuric acids significantly reduces corrosion rates. Titanium is sensitive to acidic metal chlorides like FeCl₃ or CuCl₂. Titanium is subject to corrosion in anhydrous methanol, which can be avoided by adding a small amount of water (about 3 %). Slight corrosion is possible with ammonia > 10 %.

Diamond-Like Carbon (DLC)

Diamond-Like Carbon is inert to almost all common acids, bases and solvents. There are no documented incompatibilities for HPLC applications.

Fused silica and Quartz (SiO₂)

Fused silica is used in 1290 Infinity Flow Cells and capillaries. Quartz is used for classical flow cell windows. It is inert against all common solvents and acids except hydrofluoric acid and acidic solvents containing fluorides. It is corroded by strong bases and should not be used above pH 12 at room temperature. The corrosion of flow cell windows can negatively affect measurement results. For a pH greater than 12, the use of flow cells with sapphire windows is recommended.

Gold

Gold is inert to all common HPLC solvents, acids and bases within the specified pH range. It can be corroded by complexing cyanides and concentrated acids like aqua regia.

Zirconium Oxide (ZrO₂)

Zirconium Oxide is inert to almost all common acids, bases and solvents. There are no documented incompatibilities for HPLC applications.
Preparing the Module

Solvent Information

**Platinum/Iridium**

Platinum/Iridium is inert to almost all common acids, bases and solvents. There are no documented incompatibilities for HPLC applications.

**Fluorinated polymers (PTFE, PFA, FEP, FFKM)**

Fluorinated polymers like PTFE (polytetrafluorethylene), PFA (perfluoroalkoxy) and FEP (fluorinated ethylene propylene) are inert to almost all common acids, bases, and solvents. FFKM is perfluorinated rubber, which is also resistant to most chemicals. As an elastomer, it may swell in some organic solvents like halogenated hydrocarbons.

TFE/PDD copolymer tubings, which are used in all Agilent degassers except 1322A, are not compatible with fluorinated solvents like Freon, Fluorinert, or Vertrel. They have limited life time in the presence of Hexafluoroisopropanol (HFIP). To ensure the longest possible life with HFIP, it is best to dedicate a particular chamber to this solvent, not to switch solvents, and not to let dry out the chamber. For optimizing the life of the pressure sensor, do not leave HFIP in the chamber when the unit is off.

**Sapphire, Ruby and Al₂O₃-based ceramics**

Sapphire, ruby and ceramics based on aluminum oxide Al₂O₃ are inert to almost all common acids, bases and solvents. There are no documented incompatibilities for HPLC applications.
This chapter provides information on how to optimize the Multi Column Thermostat.
Optimizing the Column Compartment

For best performance results of the multi column compartment:

- Use short connection capillaries and place them close to the heat exchanger. This will reduce heat dissipation and external band-broadening.
- See the Consumables sections for additional available heat exchangers with various internal volume to address certain applications in terms of flow rates and dispersion volume optimization.
- Keep the left and right heat exchanger temperature the same unless you do specific applications.
  Use the Divider Assy which is part of the Accessory Kit whenever you work with different temperatures on the left and right heater element to verify an optimized separation of both temperature zones. See also “Install the Divider Assembly” on page 56
- Keep the front cover closed during analysis.
6 Troubleshooting and Diagnostics

Available Tests vs User Interfaces 72
Agilent Lab Advisor Software 73

Overview about the troubleshooting and diagnostic features.
Available Tests vs User Interfaces

- Depending on the user interface, the available tests and the screens/reports may vary (see chapter "Test Functions and Calibrations").
- Preferred tool should be the Agilent Lab Advisor software, see “Agilent Lab Advisor Software” on page 73.
- The Agilent ChemStation may not include any maintenance/test functions.
- Screenshots used within these procedures are based on the Agilent Lab Advisor software.
The Agilent Lab Advisor Software is a standalone product that can be used with or without a chromatographic data system. Agilent Lab Advisor helps to manage the lab for high-quality chromatographic results by providing a detailed system overview of all connected analytical instruments with instrument status, Early Maintenance Feedback counters (EMF), instrument configuration information, and diagnostic tests. By the push of a button, a detailed diagnostic report can be generated. Upon request, the user can send this report to Agilent for a significantly improved troubleshooting and repair process.

The Agilent Lab Advisor software is available in two versions:

- Lab Advisor Basic
- Lab Advisor Advanced

Lab Advisor Basic is included with every Agilent 1200 Infinity Series and Agilent InfinityLab LC Series instruments.

The Lab Advisor Advanced features can be unlocked by purchasing a license key, and include real-time monitoring of instrument actuals, all various instrument signals, and state machines. In addition, all diagnostic test results, calibration results, and acquired signal data can be uploaded to a shared network folder. The Review Client included in Lab Advisor Advanced allows to load and examine the uploaded data no matter on which instrument it was generated. This makes Data Sharing an ideal tool for internal support groups and users who want to track the instrument history of their analytical systems.

The optional Agilent Maintenance Wizard Add-on provides an easy-to-use, step-by-step multimedia guide for performing preventive maintenance on Agilent 1200 Infinity and Agilent InfinityLab LC Series instruments.

The tests and diagnostic features that are provided by the Agilent Lab Advisor software may differ from the descriptions in this manual. For details, refer to the Agilent Lab Advisor software help files.

General Error Messages 77
  Timeout 77
  Shutdown 77
  Remote Timeout 78
  Lost CAN Partner 78
  Leak 79
  Leak Sensor Open 79
  Leak Sensor Short 80
  Compensation Sensor Open 80
  Compensation Sensor Short 81

MCT Error Messages 82
  VALVE INIT FAILED 82
  VALVE_FAILED 83
  VALVE_TAG VIOLATION 83
  WRONG VALVE 84
  WAIT TIMEOUT 85
  HEATEX OVERTEMP 85
  UHX SENSOR ERROR 85
  LHX SENSOR ERROR 86
  LHS_SENSOR_ERROR 86
  PELTIER OVERCURRENT 87
  LEFT PELTIER ERROR 87
  RIGHT PELTIER ERROR 87

This chapter describes the meaning of error messages, and provides information on probable causes and suggested actions how to recover from error conditions.
The red status indicator at the front of the module is switched on, and an entry is written into the module logbook.

If an error occurs outside a method run, other modules will not be informed about this error. If it occurs within a method run, all connected modules will get a notification, all LEDs get red and the run will be stopped. Depending on the module type, this stop is implemented differently. For example, for a pump the flow will be stopped for safety reasons. For a detector, the lamp will stay on in order to avoid equilibration time. Depending on the error type, the next run can only be started, if the error has been resolved, for example liquid from a leak has been dried. Errors for presumably single time events can be recovered by switching on the system in the user interface.

Special handling is done in case of a leak. As a leak is a potential safety issue and may have occurred at a different module from where it has been observed, a leak always causes a shutdown of all modules, even outside a method run.

In all cases, error propagation is done via the CAN bus or via an APG/ERI remote cable (see documentation for the APG/ERI interface).
General Error Messages

General error messages are generic to all HPLC modules.

Timeout

Error ID: 0062

The timeout threshold was exceeded.

Probable cause

1. The analysis was completed successfully, and the timeout function switched off the module as requested.

2. A not-ready condition was present during a sequence or multiple-injection run for a period longer than the timeout threshold.

Suggested actions

1. Check the logbook for the occurrence and source of a not-ready condition. Restart the analysis where required.

2. Check the logbook for the occurrence and source of a not-ready condition. Restart the analysis where required.

Shutdown

Error ID: 0063

An external instrument has generated a shutdown signal on the remote line.

The module continually monitors the remote input connectors for status signals. A LOW signal input on pin 4 of the remote connector generates the error message.

Probable cause

1. Leak detected in another module with a CAN connection to the system.

2. Leak detected in an external instrument with a remote connection to the system.

3. Shut-down in an external instrument with a remote connection to the system.

4. The degasser failed to generate sufficient vacuum for solvent degassing.

Suggested actions

Fix the leak in the external instrument before restarting the module.

Fix the leak in the external instrument before restarting the module.

Check external instruments for a shut-down condition.

Check the vacuum degasser for an error condition. Refer to the Service Manual for the degasser or the pump that has the degasser built-in.
Remote Timeout

Error ID: 0070

A not-ready condition is still present on the remote input. When an analysis is started, the system expects all not-ready conditions (for example, a not-ready condition during detector balance) to switch to run conditions within one minute of starting the analysis. If a not-ready condition is still present on the remote line after one minute the error message is generated.

Probable cause | Suggested actions
--- | ---
1 Not-ready condition in one of the instruments connected to the remote line. | Ensure the instrument showing the not-ready condition is installed correctly, and is set up correctly for analysis.
2 Defective remote cable. | Exchange the remote cable.
3 Defective components in the instrument showing the not-ready condition. | Check the instrument for defects (refer to the instrument’s documentation).

Lost CAN Partner

Error ID: 0071

During an analysis, the internal synchronization or communication between one or more of the modules in the system has failed.

The system processors continually monitor the system configuration. If one or more of the modules is no longer recognized as being connected to the system, the error message is generated.

Probable cause | Suggested actions
--- | ---
1 CAN cable disconnected. | • Ensure all the CAN cables are connected correctly.
• Ensure all CAN cables are installed correctly.
2 Defective CAN cable. | Exchange the CAN cable.
3 Defective main board in another module. | Switch off the system. Restart the system, and determine which module or modules are not recognized by the system.
Leak

Error ID: 0064

A leak was detected in the module.

The signals from the two temperature sensors (leak sensor and board-mounted temperature-compensation sensor) are used by the leak algorithm to determine whether a leak is present. When a leak occurs, the leak sensor is cooled by the solvent. This changes the resistance of the leak sensor which is sensed by the leak-sensor circuit on the main board.

<table>
<thead>
<tr>
<th>Probable cause</th>
<th>Suggested actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Condensation.</td>

<tr>
<td>4 Leaking column-switching valve seal.</td>
<td>Exchange the valve seal.</td>
</tr>
</tbody>
</table>

Leak Sensor Open

Error ID: 0083

The leak sensor in the module has failed (open circuit).

The current through the leak sensor is dependent on temperature. A leak is detected when solvent cools the leak sensor, causing the leak-sensor current to change within defined limits. If the current falls outside the lower limit, the error message is generated.

<table>

7 Error Information
General Error Messages

Leak Sensor Short

Error ID: 0082
The leak sensor in the module has failed (short circuit).
The current through the leak sensor is dependent on temperature. A leak is
detected when solvent cools the leak sensor, causing the leak sensor current to
change within defined limits. If the current increases above the upper limit,
the error message is generated.

<table>

<td>a metal component.</td>
<td>representative.</td>
</tr>
</tbody>
</table>

Compensation Sensor Open

Error ID: 0081
The ambient-compensation sensor (NTC) on the power switch board in the
module has failed (open circuit).
The resistance across the temperature compensation sensor (NTC) on the
power switch board is dependent on ambient temperature. The change in
resistance is used by the leak circuit to compensate for ambient temperature
changes. If the resistance across the sensor increases above the upper limit,
the error message is generated.

<table>

Compensation Sensor Short

Error ID: 0080

The ambient-compensation sensor (NTC) on the power switch board in the module has failed (open circuit).

The resistance across the temperature compensation sensor (NTC) on the power switch board is dependent on ambient temperature. The change in resistance is used by the leak circuit to compensate for ambient temperature changes. If the resistance across the sensor falls below the lower limit, the error message is generated.

Probable cause

1. Defective power switch assembly
2. Loose connection between the power switch board and the main board

Suggested actions

Please contact your Agilent service representative.
MCT Error Messages

These errors are module specific.

VALVE INIT FAILED

Error ID: 32030

During initialization, the valve actuator turns until the encoder reads the reference index position. An error is generated, if the reference index cannot be found within a given time.

**Probable cause** | **Suggested actions**
--- | ---
1. Defect in cable connection of valve drive control. | Please contact your Agilent service representative.
2. Defect in cable connection of valve actuator encoder reader. | Please contact your Agilent service representative.
3. Defect of valve drive or valve actuator encoder reader. | Please contact your Agilent service representative.
**VALVE_FAILED**

Error ID: 32031

Switching of the valve failed.

Probable cause

1. Mechanical problems. Friction too high or blockages on the valve drive’s motor or on the valve head.

2. Defective sensor on the valve drive motor

Suggested actions

- Check valve head for correct installation
- Try to identify the source of trouble by installing a different valve head if possible
- Contact your Agilent service representative.

**VALVE_TAG_VIOLATION**

Error ID: 32032

Reading the valve tag failed

Probable cause

1. A valve head has been exchanged (hot-plugged) while the valve drive was still powered on.

Suggested actions

- For changing the valve head follow the instructions “Replace Valve Heads.” It is important to have the MCT switched off for at least 10 s after a new valve head has been installed.
- Contact your Agilent service representative.
7 Error Information
MCT Error Messages

WRONG VALVE

Error ID: 32130

Valve not supported in this module.

Probable cause

1 A valve head has been installed which is not usable with G7116A.

Suggested actions

Only valve heads up to 600 bar or with up to four positions can be used in G7116A. Exchange the valve head with a suitable one. For changing the valve head follow the instructions Replace Valve Heads.

NOTE

For G7116B:

• 5067-4233 (8 Column Selector 1300 bar)
• 5067-4241 (2 Pos / 6 Port Valve 1300 bar)
• 5067-4240 (2 Pos / 10 Port Valve 1300 bar)
• 5067-4273 (6 Column Selector 1300 bar)

For G7116A

• 5067-4287 (4 Column Selector 600 bar)
• 5067-4137 (2 Pos / 6 Port Valve 600 bar)
• 5067-4145 (2 Pos / 10 Port Valve 600 bar)
WAIT TIMEOUT

1 Defect heater element | Please contact your Agilent service representative.  
2 Defective main board | Please contact your Agilent service representative.
7 Error Information
MCT Error Messages
This chapter describes the module's built in test functions.
Tests and Calibrations in Agilent Lab Advisor

Use the tests and diagnostic features provided in the Agilent Lab Advisor software to check if your module is working correctly.

For further details, refer to the Agilent Lab Advisor software help files.
Thermostat Function Test

Thermostat Function Test Description

The Thermostat Function Test is used to evaluate the cooling and heating performance of the two peltier elements.

The instrument starts the test as soon as the heater temperature is within 5 °C of the current measured ambient temperature. After the start the instrument is cooling down to 4 °C below the starting temperature. The cool-down time is used to determine the cooling performance. In the next step the heating performance is calculated by heating up to the test starting temperature.
Thermostat Function Test Result

A typical Thermostat Function Test profile is shown below.
System Pressure Test

For running a **System Pressure Test**, please refer to the corresponding pump manual. The **System Pressure Test** may be used for testing the tightness of a valve installed in the MCT.

**CAUTION**
Wrong use of System Pressure Test may damage components.

➤ Do not use higher test max. pressure settings as the lowest rated pressure component in the tests flow path.

**NOTE**
M4 Blank nut (5067-6141) can be used for plugging ports on column selection valves.

Maintenance

Introduction to Maintenance  96
Cautions and Warnings  97
Overview of Maintenance  99
Cleaning the Module  100
Install the Column Identification Option  101
Correcting Leaks  104
Maintain the Column Switching Valve  105
Replace Valve Heads  107
Prepare the MCT for Transportation  111
Replace the Module Firmware  112

This chapter describes the maintenance of the MCT.
Introduction to Maintenance

The module is designed for easy maintenance. The most frequent maintenances such as maintaining valve heads (if optional valve drive is installed) or replacing heat exchangers can be done from the front with module in place in the system stack.

Figure 8  Overview of maintenance parts (G7116B)

**NOTE**

There are no serviceable parts inside.

Do not open the module.
Cautions and Warnings

**WARNING** Toxic, flammable and hazardous solvents, samples and reagents

The handling of solvents, samples and reagents can hold health and safety risks.

➔ When working with these substances observe appropriate safety procedures (for example by wearing goggles, safety gloves and protective clothing) as described in the material handling and safety data sheet supplied by the vendor, and follow good laboratory practice.

➔ The volume of substances should be reduced to the minimum required for the analysis.

➔ Do not operate the instrument in an explosive atmosphere.

---

**CAUTION** Hot heat exchangers

The column compartment has two heat exchanger assemblies that might be hot.

➔ Allow them to cool down before starting repairs.

---

**WARNING** Electrical shock

Repair work at the module can lead to personal injuries, e.g. shock hazard, when the cover is opened.

➔ Do not remove the cover of the module.

➔ Only certified persons are authorized to carry out repairs inside the module.
Cautions and Warnings

**WARNING**

The module is partially energized when switched off, as long as the power cord is plugged in.

Repair work at the module can lead to personal injuries, e.g. electrical shock, when the cover is opened and the module is connected to power.

➔ Always unplug the power cable before opening the cover.

➔ Do not connect the power cable to the instrument while the covers are removed.

**WARNING**

Personal injury or damage to the product

Agilent is not responsible for any damages caused, in whole or in part, by improper use of the products, unauthorized alterations, adjustments or modifications to the products, failure to comply with procedures in Agilent product user guides, or use of the products in violation of applicable laws, rules or regulations.

➔ Use your Agilent products only in the manner described in the Agilent product user guides.

**CAUTION**

Safety standards for external equipment

➔ If you connect external equipment to the instrument, make sure that you only use accessory units tested and approved according to the safety standards appropriate for the type of external equipment.

**CAUTION**

Sample degradation and contamination of the instrument

Metal parts in the flow path can interact with the bio-molecules in the sample leading to sample degradation and contamination.

➔ For bio-inert applications, always use dedicated bio-inert parts, which can be identified by the bio-inert symbol or other markers described in this manual.

➔ Do not mix bio-inert and non-inert modules or parts in a bio-inert system.
Overview of Maintenance

The following pages describe maintenance procedures (simple repairs) that can be done without opening the main cover.

<table>
<thead>
<tr>

9 Maintenance
Cleaning the Module

Cleaning the Module

To keep the module case clean, use a soft cloth slightly dampened with water, or a solution of water and mild detergent.

**WARNING** Liquid dripping into the electronic compartment of your module can cause shock hazard and damage the module

➔ Do not use an excessively damp cloth during cleaning.

➔ Drain all solvent lines before opening any connections in the flow path.
Install the Column Identification Option

<table>
<thead>

</tr>
<tr>
<td></td>
<td>5067-5917</td>
<td>Column ID TAG Assembly</td>
</tr>
</tbody>
</table>

Preparations

- Power off the instrument.

**CAUTION**

Electronic boards and components are sensitive to electrostatic discharge (ESD). ESD can damage electronic boards and components.

Be sure to hold the column ID modules by the plastic parts, and do not touch the electrical components. Do not touch the pins of the flex-board connector.

1. Remove any tube guides and tube clip holders that may already be installed on the sides of the MCT cover.

2. Unlock the left and right (G7116B only) side cover inserts by pushing them to the rear and put them aside.
### 9 Maintenance
**Install the Column Identification Option**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Identify the left and right (G7116B only) column ID module. The ID sockets 1 to 4 are numbered from top to bottom.</td>
</tr>
<tr>
<td>4</td>
<td>Take the end of the pre-installed flex-board connector out of the holder.</td>
</tr>
<tr>
<td>5</td>
<td>Open the locking mechanism of the connector by lifting up the frame.</td>
</tr>
<tr>
<td>6</td>
<td>Push in the cable with the contacts facing to the rear.</td>
</tr>
<tr>
<td>7</td>
<td>Close the locking mechanism.</td>
</tr>
<tr>
<td>8</td>
<td>Verify that the cable is properly attached to the connector without visible offset. Repeat steps 5 to 7 if necessary.</td>
</tr>
</tbody>
</table>
**Install the Column Identification Option**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
</table>
| 9    | Attach the column ID module to the MCT cover.  
|      | ![Diagram of column ID module attachment](attachment.jpg)  
| 10   | Repeat steps 4 to 9 for the column ID module on the other side (if applicable). |
| 11   | Install the waste tube clip holder (example shows a G7116B).  
|      | ![Diagram of waste tube clip holder](attachment2.jpg) |
Correcting Leaks

When

If a leakage has occurred at the heat exchanger or at the capillary connections or at the column switching valve.

Tools required

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tissue</td>
</tr>
<tr>
<td>Pipette</td>
</tr>
<tr>
<td>Wrench, 1/4 – 5/16 inch (for capillary connections)</td>
</tr>
</tbody>
</table>

1. Remove the door.
2. Use a pipette and tissue to dry the leak sensor area.
3. Observe the capillary connections and the column switching valve for leaks and correct, if required.
4. Re-install the door.
Maintain the Column Switching Valve

When
If valve leaks.

Tools required

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wrench, 1/4 inch (supplied in HPLC Tool-Kit)</td>
</tr>
<tr>
<td>Hexagonal key, 9/64 inch (supplied in HPLC Tool-Kit)</td>
</tr>
</tbody>
</table>

1 Remove capillaries from ports.
2 Loosen each fixing stator screw two turns at a time. Remove bolts from head.
3 Remove the stator head (and stator face if applicable).
4 Remove the stator ring.
5 Remove the rotor seal (and isolation seal if damaged or contaminated).
6 Install the new isolation seal (if required). Ensure the metal spring inside the ring faces towards the valve body.
7 Install the new rotor seal.
8 Replace the stator ring. Ensure the stator ring is flush with the valve body.
9 Place the new (if required) stator face in place on the stator head. Reinstall the stator head.
10 Insert the stator screws in the stator head. Tighten the screws alternately two turns at a time until the stator head is secure.
11 Reconnect the pump capillaries to the valve ports.

**CAUTION**
Wrong use of **Pressure Test** may damage valve.

The current implementation of the **Pressure Test** automatically uses the maximum pressure generated by the pump used in the system.

➔ Do not use the test for modules having a lower maximum pressure than the pump as this will damage the valve. For example do not use 400 bar valve in a TCC or Flex Cube in combination with a 600 bar pump.

12 Perform a **Pressure Test** to ensure the valve is pressure tight.
## 9 Maintenance

**Maintain the Column Switching Valve**

<tr>
<td>5</td>
<td>Rotor seal</td>
</tr>
<tr>
<td>6</td>
<td>Bearing ring</td>
</tr>
<tr>
<td>7</td>
<td>Spanner nut (available for service only)</td>
</tr>
</tbody>
</table>

**NOTE**

Figure 9 on page 106 illustrates replacement parts for the valve heads, with the 6-column Selector valve as an example. The valves can vary in their appearance and do not necessarily include all of the illustrated parts. Neither, every spare part is available for each flavor of the valve.

Use “Valve Options Overview” on page 118 for identification of the required part numbers.
Replace Valve Heads

Several optional valve heads are available, which can be installed and exchanged easily.

Micro valves offer small internal volumes for minimum peak broadening, ideal for low flow rates in the nl/min and μl/min range.

<table>
<thead>
<tr>
<th>Parts required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Any Agilent Quick Change Valve Head.</td>
</tr>
</tbody>
</table>

For details, see “Valve Options Overview” on page 118

**WARNING**

**Toxic, flammable and hazardous solvents, samples and reagents**

The handling of solvents, samples and reagents can hold health and safety risks.

➔ Be sure that no solvent can drop out of the solvent connections when removing them from your valve head.

➔ When working with these substances observe appropriate safety procedures (for example by wearing goggles, safety gloves and protective clothing) as described in the material handling and safety data sheet supplied by the vendor, and follow good laboratory practice.

**CAUTION**

**Valve Damage**

Using a low pressure valve on the high pressure side can damage the valve.

➔ When using multiple column compartments as part of a method development solution, make sure that the high pressure valve head is connected to the autosampler and the low pressure valve head is connected to the detector.

**NOTE**

For details, please refer to the *Agilent 1290 Infinity II Method Development Solution User Guide*. 
Column Damage or Bias Measurement Results

Switching the valve to a wrong position can damage the column or bias measurement results.

➔ Fit the lobe to the groove to make sure the valve is switched to the correct position.

The valve actuator contains sensitive optical parts, which need to be protected from dust and other pollutions. Pollution of these parts can impair the accurate selection of valve ports and therefore bias measurement results.

➔ Always install a valve head for operation and storage. For protecting the actuator, a dummy valve head (part of Transportation Lock Kit (G1316-67001)) can be used instead of a functional valve. Do not touch parts inside the actuator.

The tag reader reads the valve head properties from the valve head RFID tag during initialization of the module. Valve properties will not be updated, if the valve head is replaced while the module is on. Selection of valve port positions can fail, if the instrument does not know the properties of the installed valve.

To have the valve correctly recognized by the Agilent Infinity Valve Drive you must have the valve drive powered off for at least 10 seconds.
1. Switch off the module.

2. Push the valve head for bringing it to its outer position.

3. Remove all capillary connections from the valve head.

4. Unscrew the valve head.

5. Put the new valve head onto the valve drive such that the lobe fits to the groove (see also “Installing Valve Heads” on page 48).

6. Screw the valve head onto the valve drive using the union nut (see also “Installing Valve Heads” on page 48).
9 Maintenance
Replace Valve Heads

7 Install all required capillary connections to the valve.

8 Push the valve head until it snaps in and stays in the rear position.

9 Switch on the module.
Prepare the MCT for Transportation

When

If an MCT including the Valve Drive Option shall be transported

**NOTE**
The module has been shipped with transportation locks, which must be used for transportation protection.

**CAUTION**
Damage to Internal Parts
Mechanical shocks for example when being transported by car or shipped by post.

⇒ Install a lock (Transportation Lock Kit).

1. Remove the valve head as described in “Replace Valve Heads” on page 107.
2. Replace the valve head by the transportation valve head. Bring the transportation valve head to the outer position.
3. Fix the Transportation Lock to the MCT.

Replace the Module Firmware

**When**

The installation of newer firmware might be necessary
- if a newer version solves problems of older versions or
- to keep all systems on the same (validated) revision.

The installation of older firmware might be necessary
- to keep all systems on the same (validated) revision or
- if a new module with newer firmware is added to a system or
- if third party control software requires a special version.

**Tools required**

<table>

</table>

**Preparations**

Read update documentation provided with the Firmware Update Tool.

**To upgrade/downgrade the module’s firmware carry out the following steps:**

1. Download the required module firmware, the latest FW Update Tool and the documentation from the Agilent web.

2. For loading the firmware into the module follow the instructions in the documentation.

**Module Specific Information**

Module is a hosted module and always needs to be connected to a host with matching firmware of same revision.

Identifying Cables

Cable Overview 128
Analog Cables 130
Remote Cables 132
CAN/LAN Cables 136
RS-232 Cables 137
USB 138

This chapter provides information on cables used with the Agilent 1200 Infinity Series modules.
# Identifying Cables

## Cable Overview

**NOTE** Never use cables other than the ones supplied by Agilent Technologies to ensure proper functionality and compliance with safety or EMC regulations.

### Analog cables

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>35900-60750</td>
<td>Agilent 35900A A/D converter</td>
</tr>
<tr>
<td>01046-60105</td>
<td>Analog cable (BNC to general purpose, spade lugs)</td>
</tr>
</tbody>
</table>

### Remote cables

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5188-8029</td>
<td>ERI to general purpose</td>
</tr>
<tr>
<td>5188-8044</td>
<td>Remote Cable ERI – ERI</td>
</tr>
<tr>
<td>5188-8045</td>
<td>Remote Cable APG – ERI</td>
</tr>
<tr>
<td>5061-3378</td>
<td>Remote Cable to 35900 A/D converter</td>
</tr>
<tr>
<td>01046-60201</td>
<td>Agilent module to general purpose</td>
</tr>
</tbody>
</table>

### CAN cables

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5181-1516</td>
<td>CAN cable, Agilent module to module, 0.5 m</td>
</tr>
<tr>
<td>5181-1519</td>
<td>CAN cable, Agilent module to module, 1 m</td>
</tr>
</tbody>
</table>
### LAN cables

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>5023-0203</td>
<td>Cross-over network cable, shielded, 3 m (for point to point connection)</td>
</tr>
<tr>
<td>5023-0202</td>
<td>Twisted pair network cable, shielded, 7 m (for point to point connection)</td>
</tr>
</tbody>
</table>

### RS-232 cables

(Not for FUSION board)

<table>
<thead>
<tr>
<th>p/n</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>G1530-60600</td>
<td>RS-232 cable, 2 m</td>
</tr>
</tbody>
</table>
| RS232-61601 | RS-232 cable, 2.5 m  
Instrument to PC, 9-to-9 pin (female). This cable has special pin-out, and is not compatible with connecting printers and plotters. It’s also called "Null Modem Cable" with full handshaking where the wiring is made between pins 1-1, 2-3, 3-2, 4-6, 5-5, 6-4, 7-8, 8-7, 9-9. |
| 5181-1561 | RS-232 cable, 8 m                                                              |

### USB cables

  ERI (Enhanced Remote Interface)  150
  USB (Universal Serial Bus)  152
  2-bit Configuration Switch  153
Instrument Layout  154
Early Maintenance Feedback  155

This chapter describes the module in more detail on hardware and electronics.
Firmware Description

The firmware of the instrument consists of two independent sections:
- a non-instrument specific section, called *resident system*
- an instrument specific section, called *main system*

**Resident System**

This resident section of the firmware is identical for all Agilent 1100/1200/1220/1260/1290 series modules. Its properties are:
- the complete communication capabilities (CAN, LAN, USB and RS-232C)
- memory management
- ability to update the firmware of the 'main system'

**Main System**

Its properties are:
- the complete communication capabilities (CAN, LAN, USB and RS-232C)
- memory management
- ability to update the firmware of the 'resident system'

In addition the main system comprises the instrument functions that are divided into common functions like
- run synchronization through APG remote,
- error handling,
- diagnostic functions,
- or module specific functions like
  - internal events such as lamp control, filter movements,
  - raw data collection and conversion to absorbance.
**Firmware Updates**

Firmware updates can be done using the following tools (latest version should be used):

- Agilent Lab Advisor software with files on the hard disk (*)
- Firmware Update Tool with local files on the hard disk (*)
- Instant Pilot (G4208A) with files on a USB Flash Disk

The file naming conventions are:

PPPP_RVVV_XXX.dlb, where

PPPP is the product number, for example, 1315B for the G1315B DAD,

R the firmware revision, for example, A for G1315B or B for the G1315C DAD,

VVV is the revision number, for example 650 is revision 6.50,

XXX is the build number of the firmware.

For instructions on firmware updates refer to section *Replacing Firmware* in chapter "Maintenance" or use the documentation provided with the *Firmware Update Tools*.

**NOTE**

Update of main system can be done in the resident system only. Update of the resident system can be done in the main system only.

Main and resident firmware must be from the same set.
Some modules are limited in downgrading due to their main board version or their initial firmware revision. For example, a G1315C DAD SL cannot be downgraded below firmware revision B.01.02 or to a A.xx.xx.

Some modules can be re-branded (e.g. G1314C to G1314B) to allow operation in specific control software environments. In this case the feature set of the target type are use and the feature set of the original are lost. After re-branding (e.g. from G1314B to G1314C), the original feature set is available again.

All these specific informations are described in the documentation provided with the firmware update tools.

The firmware update tools, firmware and documentation are available from the Agilent web.

Electrical Connections

- The CAN bus is a serial bus with high-speed data transfer. The two connectors for the CAN bus are used for internal module data transfer and synchronization.
- One analog output provides signals for integrators or data handling systems.
- The ERI/REMOTE connector may be used in combination with other analytical instruments from Agilent Technologies if you want to use features such as start, stop, common shutdown, prepare, and so on.
- With the appropriate software, the LAN connector may be used to control the module from a computer through a LAN connection. This connector is activated and can be configured with the configuration switch.
- With the appropriate software, the USB connector may be used to control the module from a computer through a USB connection.
- The power input socket accepts a line voltage of 100 – 240 VAC ± 10 % with a line frequency of 50 or 60 Hz. Maximum power consumption varies by module. There is no voltage selector on your module because the power supply has wide-ranging capability. There are no externally accessible fuses because automatic electronic fuses are implemented in the power supply.

NOTE

Never use cables other than the ones supplied by Agilent Technologies to ensure proper functionality and compliance with safety or EMC regulations.
Rear View of the Module

Information on Instrument Serial Number

Serial Number Information 1200 Series and 1290 Infinity

The serial number information on the instrument labels provide the following information:

CCYWWSSSSS Format

CC country of manufacturing
- DE = Germany
- JP = Japan
- CN = China

YWW year and week of last major manufacturing change, e.g. 820 could be week 20 of 1998 or 2008

SSSSS real serial number

Serial Number Information 1260/1290 Infinity

The serial number information on the instrument labels provide the following information:

CCXZZ00000 Format

CC Country of manufacturing
- DE = Germany
- JP = Japan
- CN = China

X Alphabetic character A-Z (used by manufacturing)

ZZ Alpha-numeric code 0-9, A-Z, where each combination unambiguously denotes a module (there can be more than one code for the same module)

00000 Serial number
The Agilent 1200 Infinity Series II modules provide the following interfaces:

<td>Requires a HOST module via CAN</td>
</tr>
</tbody>
</table>

**NOTE** The detector (DAD/MWD/FLD/VWD/RID) is the preferred access point for control via LAN. The inter-module communication is done via CAN.
- CAN connectors as interface to other modules
- LAN connector as interface to the control software
- RS-232C as interface to a computer
- USB (Universal Series Bus) as interface to a computer
- REMOTE connector as interface to other Agilent products
- Analog output connector(s) for signal output

**Overview Interfaces**

**CAN**

The CAN is inter-module communication interface. It is a 2-wire serial bus system supporting high speed data communication and real-time requirement.

**LAN**

The modules have either an interface slot for an LAN card (e.g. Agilent G1369B/C LAN Interface) or they have an on-board LAN interface (e.g. detectors G1315C/D DAD and G1365C/D MWD). This interface allows the control of the module/system via a PC with the appropriate control software. Some modules have neither on-board LAN nor an interface slot for a LAN card (e.g. G1170A Valve Drive or G4227A Flex Cube). These are hosted modules and require a Host module with firmware B.06.40 or later or with additional G1369C LAN Card.

**NOTE**

If an Agilent detector (DAD/MWD/FLD/VWD/RID) is in the system, the LAN should be connected to the DAD/MWD/FLD/VWD/RID (due to higher data load). If no Agilent detector is part of the system, the LAN interface should be installed in the pump or autosampler.
12 Hardware Information

Interfaces

USB

The USB interface replaces the RS-232 Serial interface in new FUSION generation modules. For details on USB refer to “USB (Universal Serial Bus)” on page 152.

Analog Signal Output

The analog signal output can be distributed to a recording device. For details refer to the description of the module’s main board.

Remote (ERI)

The ERI (Enhanced Remote Interface) connector may be used in combination with other analytical instruments from Agilent Technologies if you want to use features as common shut down, prepare, and so on.

It allows easy connection between single instruments or systems to ensure coordinated analysis with simple coupling requirements.

The subminiature D connector is used. The module provides one remote connector which is inputs/outputs (wired- or technique).

To provide maximum safety within a distributed analysis system, one line is dedicated to SHUT DOWN the system’s critical parts in case any module detects a serious problem. To detect whether all participating modules are switched on or properly powered, one line is defined to summarize the POWER ON state of all connected modules. Control of analysis is maintained by signal readiness READY for next analysis, followed by START of run and optional STOP of run triggered on the respective lines. In addition PREPARE and START REQUEST may be issued. The signal levels are defined as:

- standard TTL levels (0 V is logic true, + 5.0 V is false),
- fan-out is 10,
- input load is 2.2 kOhm against + 5.0 V, and
- output are open collector type, inputs/outputs (wired- or technique).

NOTE

All common TTL circuits operate with a 5 V power supply. A TTL signal is defined as "low" or L when between 0 V and 0.8 V and "high" or H when between 2.0 V and 5.0 V (with respect to the ground terminal).
Special Interfaces

There is no special interface for this module.
**ERI (Enhanced Remote Interface)**

ERI replaces the AGP Remote Interface that is used in the HP 1090/1040/1050/1100 HPLC systems and Agilent 1100/1200/1200 Infinity HPLC modules. All new 1200 Infinity II products using the FUSION core electronics use ERI. This interface is already used in the Agilent Universal Interface Box 2 (UIB2)

**ERI Description**

The ERI interface contains eight individual programmable input/output pins. In addition, it provides 24 V power and 5 V power and a serial data line to detect and recognize further add-ons that could be connected to this interface. This way the interface can support various additional devices like sensors, triggers (in and out) and small controllers, etc.

![ERI Interface](Figure 17 Location of the ERI interface (example shows a G7114A/B VWD))
**IO (Input/Output) Lines**

- Eight generic bi-directional channels (input or output).
- Same as the APG Remote.
- Devices like valves, relays, ADCs, DACs, controllers can be supported/controlled.

**1-Wire Data (Future Use)**

This serial line can be used to read out an EPROM or write into an EPROM of a connected ERI-device. The firmware can detect the connected type of device automatically and update information in the device (if required).
5V Distribution (Future Use)

- Available directly after turn on/off the hosting module (assures that certain base functionality of the device can be detected by firmware).
- For digital circuits or similar.
- Provided 500 mA maximum.
- Short-circuit proof with automatic switch off (by firmware).

24V Distribution (Future Use)

- Available by firmware command (defined turn on/off).
- For devices that need higher power
  - Class 0: 0.5 A maximum (12 W)
  - Class 1: 1.0 A maximum (24 W)
  - Class 2: 2.0 A maximum (48 W)
- Class depends on hosting module’s internal power overhead.
- If a connected device requires more power the firmware detects this (overcurrent detection) and provides the information to the user interface.
- Fuse used for safety protection (on board).
- Short circuit will be detected through hardware.

USB (Universal Serial Bus)

USB (Universal Serial Bus) - replaces RS232, supports:
- a PC with control software (for example Agilent Lab Advisor)
- USB Flash Disk
2-bit Configuration Switch

(0 = up, 1 = down)
Instrument Layout

The industrial design of the module incorporates several innovative features. It uses Agilent’s E-PAC concept for the packaging of electronics and mechanical assemblies. This concept is based upon the use of expanded polypropylene (EPP) layers of foam plastic spacers in which the mechanical and electronic boards components of the module are placed. This pack is then housed in a metal inner cabinet which is enclosed by a plastic external cabinet. The advantages of this packaging technology are:

• virtual elimination of fixing screws, bolts or ties, reducing the number of components and increasing the speed of assembly/disassembly,

• the plastic layers have air channels molded into them so that cooling air can be guided exactly to the required locations,

• the plastic layers help cushion the electronic and mechanical parts from physical shock, and

• the metal inner cabinet shields the internal electronics from electromagnetic interference and also helps to reduce or eliminate radio frequency emissions from the instrument itself.
## Early Maintenance Feedback

Maintenance requires the exchange of components which are subject to wear or stress. Ideally, the frequency at which components are exchanged should be based on the intensity of usage of the module and the analytical conditions, and not on a predefined time interval. The early maintenance feedback (EMF) feature monitors the usage of specific components in the instrument, and provides feedback when the user-selectable limits have been exceeded. The visual feedback in the user interface provides an indication that maintenance procedures should be scheduled.

### EMF Counters

**EMF counters** increment with use and can be assigned a maximum limit which provides visual feedback in the user interface when the limit is exceeded. Some counters can be reset to zero after the required maintenance procedure.

<table>
<thead>
<tr>
<th>Lamp Type</th>
<th>Counter Reset</th>
<th>Comment</th>

</thead>
<tbody>
<tr>
<td>lamp with RFID tag</td>
<td>NO</td>
<td></td>
</tr>
<tr>
<td>lamp without RFID tag</td>
<td>YES</td>
<td>via Lab Advisor or Instant Pilot</td>
</tr>
</tbody>
</table>

The detector provides the following EMF counters:
- Deuterium Lamp On-Time
- Number of UV lamp ignitions

### Using the EMF Counters

The user-settable EMF limits for the **EMF Counters** enable the early maintenance feedback to be adapted to specific user requirements. The useful maintenance cycle is dependent on the requirements for use. Therefore, the definition of the maximum limits need to be determined based on the specific operating conditions of the instrument.
**Setting the EMF Limits**

The setting of the EMF limits must be optimized over one or two maintenance cycles. Initially the default EMF limits should be set. When instrument performance indicates maintenance is necessary, take note of the values displayed by the EMF counters. Enter these values (or values slightly less than the displayed values) as EMF limits, and then reset the EMF counters to zero. The next time the EMF counters exceed the new EMF limits, the EMF flag will be displayed, providing a reminder that maintenance needs to be scheduled.

**NOTE**

This function is only available via Agilent Lab Advisor or Instant Pilot.
This chapter provides additional information on safety, legal, and web.
General Safety Information

General Safety Information

The following general safety precautions must be observed during all phases of operation, service, and repair of this instrument. Failure to comply with these precautions or with specific warnings elsewhere in this manual violates safety standards of design, manufacture, and intended use of the instrument. Agilent Technologies assumes no liability for the customer’s failure to comply with these requirements.

**WARNING**

Ensure the proper usage of the equipment.

The protection provided by the equipment may be impaired.

➔ The operator of this instrument is advised to use the equipment in a manner as specified in this manual.

Safety Standards

This is a Safety Class I instrument (provided with terminal for protective earthing) and has been manufactured and tested according to international safety standards.

General

Do not use this product in any manner not specified by the manufacturer. The protective features of this product may be impaired if it is used in a manner not specified in the operation instructions.
Before Applying Power

**WARNING** 
Wrong voltage range, frequency or cabling
Personal injury or damage to the instrument

➔ Verify that the voltage range and frequency of your power distribution matches to the power specification of the individual instrument.

➔ Never use cables other than the ones supplied by Agilent Technologies to ensure proper functionality and compliance with safety or EMC regulations.

➔ Make all connections to the unit before applying power.

---

**NOTE**
Note the instrument’s external markings described under “Safety Symbols” on page 162.

---

Ground the Instrument

**WARNING** 
Missing electrical ground
Electrical shock

➔ If your product is provided with a grounding type power plug, the instrument chassis and cover must be connected to an electrical ground to minimize shock hazard.

➔ The ground pin must be firmly connected to an electrical ground (safety ground) terminal at the power outlet. Any interruption of the protective (grounding) conductor or disconnection of the protective earth terminal will cause a potential shock hazard that could result in personal injury.
13 Appendix
General Safety Information

Do Not Operate in an Explosive Atmosphere

**WARNING**
Presence of flammable gases or fumes
Explosion hazard

➡ Do not operate the instrument in the presence of flammable gases or fumes.

Do Not Remove the Instrument Cover

**WARNING**
Instrument covers removed
Electrical shock

➡ Do Not Remove the Instrument Cover

➡ Only Agilent authorized personnel are allowed to remove instrument covers.
Always disconnect the power cables and any external circuits before removing the instrument cover.

Do Not Modify the Instrument

Do not install substitute parts or perform any unauthorized modification to the product. Return the product to an Agilent Sales and Service Office for service and repair to ensure that safety features are maintained.

In Case of Damage

**WARNING**
Damage to the module
Personal injury (for example electrical shock, intoxication)

➡ Instruments that appear damaged or defective should be made inoperative and secured against unintended operation until they can be repaired by qualified service personnel.
Solvents

**WARNING**

**Toxic, flammable and hazardous solvents, samples and reagents**

The handling of solvents, samples and reagents can hold health and safety risks.

- ➔ When working with these substances observe appropriate safety procedures (for example by wearing goggles, safety gloves and protective clothing) as described in the material handling and safety data sheet supplied by the vendor, and follow good laboratory practice.

- ➔ Do not use solvents with an auto-ignition temperature below 200 °C (392 °F). Do not use solvents with a boiling point below 56 °C (133 °F).

- ➔ Avoid high vapor concentrations. Always keep the temperature in the sample compartment at least 25 K below the boiling point of the solvent used.

- ➔ Do not operate the instrument in an explosive atmosphere.

- ➔ Reduce the volume of substances to the minimum required for the analysis.

- ➔ Never exceed the maximum permissible volume of solvents (8 L) in the solvent cabinet. Do not use bottles that exceed the maximum permissible volume as specified in the usage guideline for solvent cabinet.

- ➔ Ground the waste container.

- ➔ Regularly check the filling level of the waste container. The residual free volume in the waste container must be large enough to collect the waste liquid.

- ➔ To achieve maximal safety, regularly check the tubing for correct installation.

---

**NOTE**

For details, see the usage guideline for the solvent cabinet. A printed copy of the guideline has been shipped with the solvent cabinet, electronic copies are available in the Agilent Information Center or via the Internet.

**WARNING**

A WARNING alerts you to situations that could cause physical injury or death.

→ Do not proceed beyond a warning until you have fully understood and met the indicated conditions.

**CAUTION**

A CAUTION alerts you to situations that could cause loss of data, or damage of equipment.

→ Do not proceed beyond a caution until you have fully understood and met the indicated conditions.
Refrigerant

The refrigerant HFC-134a is used only in the Agilent Infinity II Sample Cooler.

Table 12  Physical properties of refrigerant HFC-134a

<table>

</tr>
</tbody>
</table>
Refri gerant HFC-134a is known as a safe refrigerant, however accidents can occur if it is handled incorrectly. For this reason, the following instructions must be observed:

➔ Avoid contact with liquid refrigerant HFC-134a. At atmospheric pressure HFC-134a evaporates at approximately -26 °C and causes frost bite.

➔ After skin contact, rinse the affected area with water.

➔ After eye contact, rinse the eye(s) with plenty of water for at least 15 minutes and consult a doctor.

➔ HFC-134a must not be allowed to escape in enclosed areas. Although HFC-134a is not toxic, there is a danger of suffocation as gaseous refrigerant is heavier than air.

➔ Please observe the following first aid instructions. After inhalation, move the affected person to fresh air, keep him warm and allow him to rest. If necessary, he should be supplied with oxygen. If he has stopped breathing or is breathing erratically, he should be given artificial respiration. In the case of cardiac arrest, carry out heart massage. Send for a doctor immediately.

➔ Moreover, it must be noted that HFC-134a must always be extracted from the system and collected. It must never be discharged into the atmosphere on environmental grounds (greenhouse effect).

General hazards and improper disposal

Improper disposal of the media and components used pollutes the environment.

➔ The breakdown of the sample cooler unit must be carried out by specialist refrigeration company.

➔ All media must be disposed of in accordance with national and local regulations.

➔ Please contact your local Agilent Service Center in regard to safe environmental disposal of the appliance or check www.agilent.com for more info.
Waste Electrical and Electronic Equipment Directive

Abstract

NOTE

This product complies with the WEEE Directive (2002/96/EC) marking requirements. The affixed label indicates that you must not discard this electrical/electronic product in domestic household waste.

Product Category:

With reference to the equipment types in the WEEE Directive Annex I, this product is classed as a Monitoring and Control Instrumentation product.

NOTE

Do not dispose of in domestic household waste

To return unwanted products, contact your local Agilent office, or see http://www.agilent.com for more information.
Radio Interference

Cables supplied by Agilent Technologies are screened to provide optimized protection against radio interference. All cables are in compliance with safety or EMC regulations.

Test and Measurement

If test and measurement equipment is operated with unscreened cables, or used for measurements on open set-ups, the user has to assure that under operating conditions the radio interference limits are still met within the premises.
Sound Emission

Manufacturer’s Declaration

This statement is provided to comply with the requirements of the German Sound Emission Directive of 18 January 1991.

This product has a sound pressure emission (at the operator position) < 70 dB.

• Sound Pressure Lp < 70 dB (A)
• At Operator Position
• Normal Operation
• According to ISO 7779:1988/EN 27779/1991 (Type Test)
Agilent Technologies on Internet

In This Book

This manual contains technical reference information about the Agilent 1290 Infinity II Multicolumn Thermostat (G7116B). The manual describes the following:

- Introduction,
- requirements and specifications,
- using and optimizing,
- troubleshooting and diagnose,
- maintenance
- parts identification,
- hardware information,
- safety and related information.
