Contents

1 Overview

Agilent Genomic Workbench 6.5 is a comprehensive design and analysis tool that you use to design microarrays and SureSelect Target Enrichment Kits, and to analyze your microarray experiments. Its capabilities are included in two software packages: a Standard Edition that gives full functionality, and a Lite Edition that provides a subset of the features. This guide gives an overview of the Lite Edition of Agilent Genomic Workbench.

This chapter gives you a high-level overview of the Lite Edition of Agilent Genomic Workbench. Chapter 2 tells you how to start and find Help for each module, and Chapter 3 gives you more details about each application.

Agilent Technologies

Features of the Agilent Genomic Workbench Lite Edition

The Agilent Genomic Workbench Lite Edition software provides a robust data management and integrated data analysis environment for Agilent genomics applications, including comparative genomic hybridization (CGH), chromatin immunoprecipitation (ChIP), and methylation (CH3).

When used with Agilent Feature Extraction software (installed separately), the Agilent Genomic Workbench Lite Edition lets you manage, extract, analyze, and produce reports for your microarrays with little or no intervention. You can also use the program interactively to analyze and examine data in more detail.

Using the Agilent SureSelect Target Enrichment system and the Agilent eArray Web site, you can design bait libraries that retrieve specific DNA fragments for sequencing. You can then use the Agilent Genomic Workbench Lite Edition SureSelect Target Enrichment application to run read depth and enrichment analyses on your next-generation sequencing data.

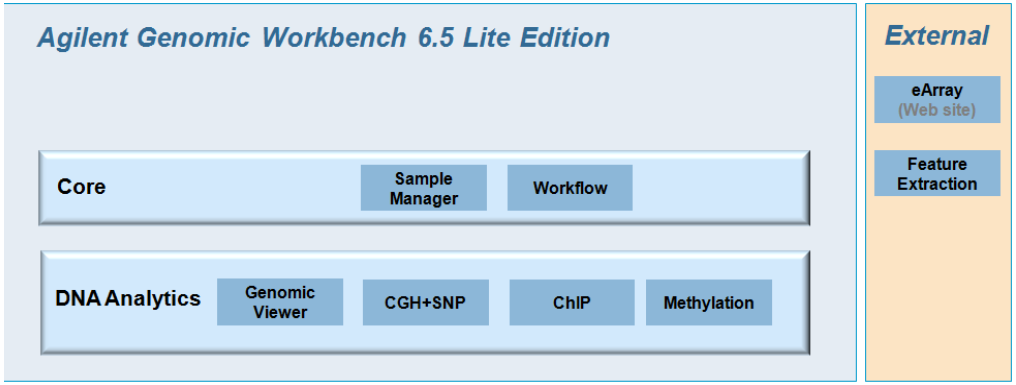

Figure 1 Programs available in Agilent Genomic Workbench Lite Edition

The software helps you:

- Manage sample information through the analysis process
- Start a program to extract features from microarray *.tif files
- Analyze data interactively

- Run a workflow to automate feature extraction and data analysis
- Produce QC reports and do enrichment analysis for target genomic regions, based on sequence read data

Automated Feature Extraction and Analysis

The Agilent Genomic Workbench Workflow is uniquely designed to meet the needs of users who are extracting and analyzing microarray data from a large number of samples.

With Agilent Feature Extraction installed (license required) and a DNA Analytics program license (CGH or ChIP), you can use Sample Manager to associate a list of image files with Array IDs and sample attributes, and then set up and run a workflow that extracts selected images. The Feature Extraction results are then automatically analyzed with a DNA Analytics analysis method.

Feature Extraction works together with the Agilent Genomic Workbench Lite Edition core utilities to create the final analytical results (Figure 3).

Sample Manager is used with Workflow and Feature Extraction to keep sample IDs and their results together during extraction; then Workflow calls a specified analysis method to run a selected algorithm on the extracted results. You can save the workflow and the analysis method for later use.

The Agilent Genomic Workbench Lite Edition user interface has Sample Manager and Workflow tabs (Figure 2). You can set up samples and run the workflow with the commands under these tabs, if you have a CGH or ChIP license.

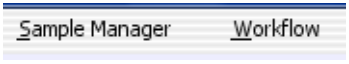

Figure 2 Sample Manager and Workflow tabs

When you run an extraction workflow, Feature Extraction runs in the background and uses a grid template that matches the AMADID in the image barcode and a default Feature Extraction protocol associated with the grid template. If you want to check images before a run, or run a sample interactively, you use the Feature Extraction software, which is separate from the Agilent Genomic Workbench Lite Edition. Refer to the *Agilent Feature Extraction User Guide* for more information on using the Feature Extraction software.

The entire Agilent microarray research pathway with the Lite Edition of Agilent Genomic Workbench looks like this:

Interactive Data Analysis for CGH, ChIP, or Methylation (CH3)

With one or more DNA Analytics licenses – CGH, ChIP, Methylation (CH3) – you can set up preprocessing, analysis, and reporting parameters interactively. The CGH program also has many postprocessing capabilities, called Discovery.

This chapter gives you more details about each of the modules within the Lite Edition of Agilent Genomic Workbench 6.5.

Agilent Technologies

Organizing and Assigning Array Attributes with Sample Manager

When you scan a hybridized microarray slide, the Agilent Microarray Scanner creates a *.tif image file that includes the Array ID from the slide. This Array ID, contained in the header of the *.tif file, uniquely identifies the slide. A microarray slide can contain one array, or for multi-pack arrays, multiple replicate arrays on the same slide. The scanned data from each microarray represents a particular sample, and each array on a slide has a unique Array ID; thus each sample has a specific Array ID.

In Sample Manager, you define and edit the sample attributes for each Array ID, such as the biological sample used, the amount of label used, or the hybridization date. See the *Sample Manager User Guide* for more information.

The attributes that you assign for each Array ID stay with the Array ID for the rest of the analysis in Agilent Genomic Workbench. This sample information can appear in reports. By default, the Global Display Name is the same as the extraction name. However, you can change the Global Display Name and your new name will appear throughout the rest of the user interface for that array (for example, in experiments, reports, etc.).

You can export attributes to an Attribute File. Later, you can import the file into Agilent Genomic Workbench to use the saved attributes.

An Attribute File contains identification information (Array ID) and attributes for one or more microarray samples. An Attribute File for a two-color experiment must at a minimum include Array ID, Global Display Name, Red Sample, Green Sample, and Polarity values. An Attribute File for a one-color experiment must include the Array ID, Global Display Name, and Green Sample. Other information may be included as well. You can create Attribute Files with a spreadsheet program, and save them as a tab-delimited text file or *.xls file.

Setting Up and Running Workflows for Extraction and/or Analysis

You can set up and run a workflow that runs Feature Extraction to automatically create log ratio data from the scanned images of your arrays. You can use this capability for many types of arrays, including CGH, ChIP, and Methylation (CH3). If you have a CGH or ChIP license, you can also set up the workflow to analyze the CGH or ChIP log ratio data right after the extraction.

NOTE You must have Feature Extraction version 10.7 or higher installed in order to run a Feature Extraction workflow using Agilent Genomic Workbench Lite Edition 6.5. To run a Feature Extraction workflow for CGH+SNP microarrays, you must have Feature Extraction version 10.10 or higher installed.

Optionally, you can use Sample Manager to organize your microarrays and define their attributes, before or after running a workflow. See "Organizing and Assigning Array Attributes with Sample Manager" on page 38 for more information.

Agilent Genomic Workbench lets you set up and run a workflow with no need for intervention (Figure 12).

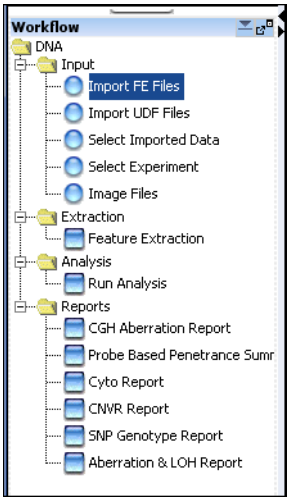

Figure 12 Workflow Navigator for CGH

You can:

- Select from a variety of input files for the workflow: import extracted data, select imported data already in the database, use files from a selected experiment, or select image files to extract
- Extract the data (from image files) using Feature Extraction
- Analyze extracted data with a CGH or ChIP analysis method
- Apply a design, feature, or array filter to the extracted data to include or exclude arrays based on user-selected criteria (CGH application only)
- Save Workflows and Analysis methods for later use
- Do one of the following:
  - Run the configured workflow to extract image files with Agilent Feature Extraction and create a QC report that contains statistics for the extraction
  - Run the configured workflow to analyze CGH, CGH+SNP, or ChIP (not Methylation) Feature Extraction data with DNA Analytics and create DNA Analytics reports
  - Run the configured workflow to extract image files and then analyze the extracted results to create both sets of reports.

With Workflow analysis, you configure an analysis method ahead of time and then run it in a workflow. This method is useful for unattended operation and consistent analyses of multiple data sets. To review workflow results, you use the Genomic Viewer. For more details and quick–start instructions to set up and run a workflow, see the *Workflow User Guide*.

Displaying Data/Results in Genomic Viewer

What is Genomic Viewer?

Genomic Viewer is the graphics and tabular display section of the Agilent Genomic Workbench main window. You can use this data *viewing* capability in Agilent Genomic Workbench without a license to view data for many types of arrays, including CGH, CGH+SNP, ChIP, and Methylation (CH3). You can use the data *analysis* capability in Agilent Genomic Workbench only if you have a license for one or more of the DNA Analytics programs (CGH, ChIP, or Methylation).

Figure 13 shows the main window of Agilent Genomic Workbench Lite Edition, and identifies the names of its components. In the Genomic Viewer, extracted data and analysis results are tabulated and displayed next to depictions of the genome, selected chromosome, and selected genes of the species whose array data you are analyzing.

Genomic Viewer contains four main views:

- **Genome View** – A graphical representation of the entire genome for the selected species. Use this view to select the chromosome to show in the other views.
- **Chromosome View** – A graphical representation of the selected chromosome, displayed with cytobands and a plot area. Click or drag the mouse to select a region to display in the Gene View.
- **Gene View** – A more detailed view of the chromosomal region selected in the Chromosome View.
- **Tab View** – A view that displays design annotation, log ratio data, and optional signal data related to the chromosome you select in Chromosome View

To learn how to display log ratio data and content without a license (experiments, gene lists and tracks), see the *Data Viewing User Guide*.

To learn how to display log ratio data, content, and results, see the *User Guide* for which you have a DNA Analytics program license.

Analyzing CGH Data Interactively

The Agilent Genomic Workbench lets you visually explore, detect, and analyze aberration patterns from multiple Comparative Genomic Hybridization (CGH) microarray profiles, either interactively or by setting up an analysis method to use with a workflow. With CGH Interactive Analysis, you set up an experiment and apply analysis algorithms to your data one experiment at a time. You also set parameters for some report templates for use in Workflow analysis.

You do most of your operations with the Preprocessing, Analysis, Discovery and Reports tabs. See Table 1 on page 12. Also see the *CGH Interactive Analysis User Guide*.

With the interactive portion of the Agilent Genomic Workbench, you can:

- Import Agilent Feature Extraction data, Axon data, or UDF files and use the Genomic Viewer to visualize this data along the chromosome
- Preprocess the data:
  - Apply feature, array, and design filters
  - Combine designs and/or inter- or intra-array replicates
  - Centralize the data, including nonunique probes
  - Display QC metrics on the original data
- Use five different robust statistical aberration detection algorithms to detect and map aberration regions with high confidence
- Display chromosomal deletions and amplifications at multiple zoom levels simultaneously
- Use Discovery options to display the analysis results in many different ways
  - Apply aberration filters on the results
  - Use the CGH program for CNV (Copy Number Variation) applications
  - Find common aberrations between several CGH samples, as well as do a differential aberration analysis
  - Do a correlation analysis of gene expression and CGH data, do a cluster analysis, and display data with a “heatmap”
- Save aberration results
- Make customizable Cytogenetic Reports for individual CGH samples

Analyzing ChIP Data Interactively

The ChIP program is a complete environment that lets you analyze chromatin immunoprecipitation (ChIP) microarray data. ChIP microarray analysis can identify the genomic loci that contain proteins that bind to DNA, including individual transcription factors, chromatin modifiers, and components of the general transcription machinery.

With ChIP interactive analysis, you set up an experiment and apply analysis algorithms to your data one experiment at a time. You also set parameters for some report templates for use in Workflow analysis.

You do most of your operations with the Preprocessing, Analysis, and Reports tabs. See Table 1 on page 12. Also see the *ChIP Interactive Analysis User Guide*.

With the interactive portion of the ChIP program, you can:

- Import data from the Agilent Feature Extraction and Axon programs
- Use an intuitive graphical interface to display data and annotations in the context of an organism's genome, at several simultaneous levels of detail
- Normalize your data with several statistical methods
- Use error modeling and event detection algorithms to identify probes, genes, and genomic loci that have significant binding
- Display significant binding events graphically within the program, and export report files that you can analyze further with other programs

Analyzing Methylation (CH3) Data

The Methylation (CH3) program is a framework used to identify methylation events in your samples. CH3 microarray analysis can help identify the CpG islands where methylation has occurred. The software helps you:

- Identify molecular events associated with DNA methylation
- Find and validate gene regulation and regulatory networks by creating high-resolution, genome-wide methylation profiles
- Show modes of action and potential therapeutic activities of compounds and target genes by understanding the relation of DNA methylation to transcriptional control

With the Methylation (CH3) program, you can:

- Import data from the Agilent Feature Extraction and Axon programs, and import UDF files
- Use an intuitive graphical interface to display data and annotations in the context of an organism's genome, at several simultaneous levels of detail
- Use a *Z*-score or Batman algorithm to calculate the probability that the regions covered by specific probes are methylated or unmethylated
- Compare the moving average of your log ratio and *Z*-score data within the boundaries of CpG Island tracks

You cannot run methylation event detection within a Workflow.

Using SureSelect Quality Analyzer

SureSelect Quality Analyzer is a program that lets you assess the effectiveness of the pull-down of targeted genomic fragments when you use the Agilent SureSelect Target Enrichment system. This system uses libraries of biotinylated RNA oligonucleotide “baits” to harvest genomic DNA fragments of interest for sequencing. This forms the basis of a powerful selection method that lets you focus your sequencing efforts.

The selective nature of the process makes it ideal for targeted resequencing using next-generation sequencing technology. After you sequence the harvested fragments, you can use SureSelect Quality Analyzer to calculate statistical metrics and perform read depth analysis. You can also perform enrichment analysis, and view the results in the UCSC Genome Browser next to the annotation tracks of your choice.
